1 Introduction

This Geotechnical Engineering Design Report presents the results of the geotechnical engineering evaluation performed by Anchor QEA, LLC (Anchor QEA) to determine the basis of design for the upper reach (river mile [RM] 3.0 to RM 5.0) of the Lower Duwamish Waterway (LDW) Superfund Site in King County, Washington. The remedial actions associated with the upper reach include dredging and capping of areas within the waterway, including areas that have waterfront or overwater structures; placing thin cover of clean material for enhanced natural recovery (ENR); and backfilling dredge areas within elevation ranges that support habitat as described in the Basis of Design Report (BODR) to which this Geotechnical Engineering Design Report is an appendix.

1.1 Locations Studied

The proposed work requires remediation within the actively managed Federal Navigation Channel (FNC), areas adjacent to waterfront and offshore structures, early actions areas (EAAs), and subtidal and intertidal areas. Subtidal areas are defined as areas below elevation -4 ft mean lower low water (MLLW). Intertidal areas represent elevations between -4 ft MLLW and the mean higher high water line (MHHW; equal to +11.4 MLLW), which horizontally defines the limit of the upper reach along sloped embankments or vertical bulkheads. Upland areas are locations above MHHW that abut and include shoreline property where buildings and structures may be encountered.

1.2 Report Structure

This Geotechnical Engineering Design Report includes six main sections:

- Section 1 is the introduction.
- Section 2 discusses the subsurface conditions underlying the site in more detail than presented in the Data Evaluation Report (DER) (Anchor QEA and Windward 2022); this section also describes the soil engineering parameters assigned to the major stratigraphic units.
- Section 3 describes the geotechnical engineering analyses performed for each of the following design elements:
 - Dredge prism side slope stability
 - Bank side slope stability
 - Cap bearing capacity and settlement evaluations
 - Backfill design
- Section 4 presents geotechnical engineering recommendations to be used by the structural engineer for the assessment of:
 - Bulkhead design, including lateral earth pressures and tieback design soil parameters
 - Pile design, including vertical and lateral pile capacity
- Section 5 discusses seismic (earthquake) evaluations for the site.

- Section 6 presents references that were used to support this work.

Attachments to this Geotechnical Engineering Design Report include:

- Attachment A – Subsurface Investigation Program and Field Logs
- Attachment B – Geotechnical laboratory testing program and test results
- Attachment C – Supplemental geotechnical information by others referenced in this report

2 Subsurface Geotechnical Conditions

Subsurface geotechnical conditions at the site were investigated by Anchor QEA to supplement the existing geotechnical information that had been collected during past projects in the vicinity of the upper reach. Details regarding these prior investigations can be found in the DER (Anchor QEA, and Windward 2022).

Subsurface geotechnical conditions in the upper reach of LDW were investigated by Anchor QEA as part of the Phase I and Phase II Pre-Design Investigation (PDI) efforts completed in 2021 and 2022. The geotechnical PDI included the following numbers and types of geotechnical investigations, which were advanced to a range of depths below ground surface:

- 29 rotosonic borings
- 20 cone penetrometer tests
- 5 vane shear tests
- 7 full-flow penetrometer tests
- 2 hand auger borings
- 2 dynamic cone penetrometer tests

The locations of these geotechnical investigations are presented in Figures C1-1a and C1-1b. Logs from these investigations are presented in Attachment A and geotechnical laboratory testing results are presented in Attachment B.

The scope of the geotechnical PDI was developed considering existing geotechnical information within the upper reach. Studies by others provide supplemental subsurface geotechnical data in upland areas adjacent to the upper reach, and at in water locations. Attachment C presents the locations with supplemental geotechnical information and lists the studies that have been identified as providing useful subsurface geotechnical data in the upper reach.

The following sections provide a more comprehensive discussion of subsurface conditions encountered at the site than is presented in the DER.

2.1 Subsurface Stratigraphy

BODR Section 8.2 summarizes the stratigraphy. The following section provides more detailed information on the geotechnical properties for the three major stratigraphic units described in the DER and BODR, for the purposes of geotechnical engineering design and analysis later described in this report.

2.1.1 *Fill*

Fill soils were encountered at two locations during the Phase II PDI and at several other upland locations investigated by others. Generally, this material had been placed to regrade the existing fluvial plain created by the Duwamish River, to support shoreline development and re-channelization of the LDW. The unit weight of this material is assumed to vary but to prepare design recommendations, the material is assumed to be conservatively represented by an overall average value of 135 pounds per cubic foot (pcf), based on laboratory direct shear test results. Grain size distribution tests show that this material is predominately sand, with varying amounts of silt. In areas where fill was more randomly placed, it would be expected to contain anthropogenic materials such as debris, which would be typical of historical shoreline development filling activities in active industrial areas. The moisture content in the fill unit generally ranges from 6% to 28%. Direct shear testing of the fill indicates a peak friction angle of average of 36 degrees and a residual friction angle average of 33 degrees.

The findings associated with the two uplands borings completed in 2021 are in general agreement with historical investigations completed by others.

2.1.2 *Recent Sediments*

Recent sediments were encountered throughout the intertidal and subtidal areas, having been naturally deposited by flows to the upper reach from Green River upstream. The thickness of this unit across the site varied widely and was thickest in areas of historical dredge activities. Based on a review of laboratory testing results, a total unit weight of 100 pcf was assumed to best represent average overall conditions, with percent moisture content ranging from 34% to 97%. Atterberg limits (plasticity) testing indicates that this material is typically non-plastic to very low plasticity, an indication that the finer fractions are predominantly silt rather than clay. Direct shear testing indicates a peak friction angle of 34 degrees for the recent sediments and a residual friction angle of 33 degrees, while vane shear testing (VST) and full-flow penetrometer (FFP) testing indicate undrained shear strengths ranging as shown in Figure C2-1. Grain size analyses indicate that this material is approximately 30% sand and 70% silt and clay, with silt content ranging from 22% to 62% and clay content ranging from 2% to 7%.

2.1.3 *Alluvium*

Investigations prior to the PDI describe the alluvium by referencing an upper unit and a lower unit. In the DER, the description of the alluvium was combined into a single unit, recognizing that there are some gradational changes in the alluvium with depth. Alluvium was observed to underly the recent sediments and be predominately coarse-grained material with pockets, lenses, and layers of silt and clay. Silt content of the fine-grained layers was as high as 76%, and clay content was as high as 16%;

silt and clay content was observed to be as low as 1.5%. The alluvium unit has a typical specific gravity of 2.5 to 2.7; is non-plastic; and has a typical total unit weight of 125 pcf, a measured peak friction angle ranging from 32 to 40 degrees (average 37 degrees), and a measured residual friction angle ranging from 28 to 37 degrees (average 32 degrees).

2.2 Groundwater and Surface Water Elevations

Groundwater and surface water affect the geotechnical behavior of soils and sediments. Water surface elevations are used in geotechnical engineering evaluations to calculate pore water pressures and effective stresses, which govern the shear strength of soils. Changes in effective stress (which occur due to changes in pore water pressure) also lead to consolidation settlement. Thus, water surface elevations are a key input parameter for geotechnical engineering evaluations. This section summarizes general observations of groundwater and surface water levels made during the geotechnical investigation and as summarized in other reports.

2.2.1 Groundwater

Groundwater has been observed in shoreline groundwater wells along the upper reach. At locations nearest the LDW, groundwater elevations vary regularly in accordance with the water level in the river. Further from the shoreline, groundwater levels are less affected by the adjacent surface water level but are still expected to vary seasonally. Table C2-1 summarizes typically observed groundwater levels at selected locations along the upper reach for exploration locations adjacent to the LDW, which are used as a basis for geotechnical engineering evaluations described in this report.

**Table C2-1
Summary of Selected Groundwater Levels for Exploration Locations Adjacent to the LDW**

Location	River Mile	Observed Groundwater Elevation Range (ft MLLW)	Observed Depth to Groundwater Range Below Ground Surface (ft)	Reference
Boeing Plant 2	2.9 E	7 to 11	6 to 11.5	AMEC 2012
Boeing Isaacson/Thompson	3.8 E	3 to 10	11 to 17	Landau and Amec 2014
Terminal 117	3.6 W	8 to 10	3 to 20	GeoEngineers 2014
Dallas Avenue Drainage Project	3.6 W	8	10	SPU 2014
Delta Boat Lift	4.2 W	8	7	AMEC 2002
SPU Duwamish Substation	4.5 W	6 to 8	10 to 12	SPU 2012

Note:
MLLW: mean lower low water

2.2.2 Surface Water

The upper reach is tidally influenced, and water levels are also affected by inflows from Green River upstream. Upstream inflows are controlled by the Howard Hansen Dam, so tidal influences tend to dominate the river stage (surface water elevation) on a daily basis. In the project vertical datum, the MHHW elevation is 11.3 ft, and the MLLW elevation is 0 ft.

2.3 Soil Engineering Modeling Parameters

This section summarizes the geotechnical engineering properties that were assigned to each lithologic unit for geotechnical evaluations. Engineering properties were derived using correlations to *in situ* cone penetrometer test (CPT) results, vane shear test results, full flow penetrometer test results, and geotechnical laboratory testing results. For cap aggregates, habitat materials, and backfill, engineering parameters were assigned using best professional judgment and from past project experience considering the method of placement (under water) and the typical materials used for these applications (sand and gravel). Soil parameters are presented in Table C2-2.

**Table C2-2
Soil Parameters for Slope Stability Analysis of Dredge Prism Side Slopes**

Soil Layer	Total Unit Weight (pcf)	Undrained Shear Strength ¹		Drained Shear Strength		Compressibility
		Cohesion (psf)	Internal Friction Angle, ϕ' (degrees)	Cohesion (psf)	Internal ϕ' (degrees)	Compression Ratio (unitless)
Fill	135	NA	NA	0	33	See Note 2
Recent sediments	100	$10+38*Z;$ ≤ 200	0	0	27	0.17
Alluvium	125	$100+30*Z;$ ≤ 1800	0	0	32	0.09
Cap, habitat and backfill materials	110	NA	NA	0	32	See Note 2

Notes:

1. Z = depth below top of layer surface elevation
2. The fill, cap, habitat, and backfill materials, being primarily granular, were not considered compressible for purposes of consolidation calculations. See discussion of compressibility

NA: not applicable. See discussion of Undrained Shear Strength.

pcf: pounds per cubic foot

psf: pounds per square foot

2.3.1 Undrained Shear Strength

Undrained shear strength can be directly estimated from the tip resistance measured during advancement of the cone during CPT and full flow penetrometer testing, allowing for a near-

continuous relationship of undrained shear strength versus depth (Robertson and Cabal 2010). For the purposes of this report, undrained shear strength values were determined by inspection of the full flow penetrometer test and vane shear test results at each location. This inspection was completed by plotting undrained shear strength with depth.

Figure C2-1 presents the measured undrained shear strength with depth. Analysis of this plot shows that the undrained shear strength for the recent sediments, as well as for the compressible layers within the alluvium, increases linearly with depth. Thus, the design assumes undrained shear strength is variable, as presented in Table C2-2. Undrained shear strength is not relevant for cohesionless materials (e.g., sand and gravel), which rely on inter-particle friction to develop strength. Thus, the undrained shear strength for sand and gravel type materials (fill, cap, habitat and backfill) is not applicable, as these materials are not expected to behave in an undrained manner.

2.3.2 *Drained Shear Strength*

Drained shear strength applies to the long-term behavior of fine-grained materials and both the short- and long-term behavior of granular materials, which drain very rapidly under applied loads. Drained shear strength can be correlated to *in situ* tests (e.g., standard penetration test [SPT] blow counts, CPT records) and can be measured in laboratory geotechnical tests.

For this project, a series of direct shear tests was conducted on representative undisturbed samples from each major stratigraphic unit to evaluate drained shear strength behavior in terms of peak and residual friction angles. In general, average peak friction angles ranged from 34 to 37 degrees, and average residual friction angles ranged from 32 to 33 degrees.

Laboratory testing is conducted under ideal conditions and reflects assumed loading rates and drainage conditions that potentially will not apply under full-scale conditions. It is expected that actual soil behavior will be more variable and reflect inherent uncertainty that cannot be captured by laboratory testing alone. Thus, the laboratory test results were reviewed by an experienced geotechnical engineer, who applied engineering judgment to reduce the friction angle (drained shear strength) selected for design to reflect values more typically used regionally in engineering design. See Table C2-2 for a summary of friction angles that were selected for design for each major geologic unit.

2.3.3 *Compressibility*

Consolidation settlement (i.e., compression) occurs over time as new loads are applied to fine-grained soil or sediment, and as water is driven out of the soil/sediment pore space due to the applied loading (i.e., drainage).

Compressibility parameters were assessed using the laboratory one-dimensional oedometer consolidation test. The test incrementally loads an undisturbed sample and measures the corresponding settlement, which is plotted as a relationship between stress (load) and strain (settlement). When stress is plotted in log scale and strain in natural scale, the resulting plot is generally linear over the range of virgin compression, and the slope of this line is referred to as the Compression Ratio. The Compression Ratio can be used to calculate anticipated consolidation under load.

Four oedometer tests were conducted: one in the recent sediment unit, two within the sandy alluvium, and one in the silty alluvium. The results of these tests were evaluated to develop the consolidation parameters summarized in Table C2-2.

The time rate of consolidation is affected by the distance that water must travel when drainage is occurring. Through inspection of the CPT porewater pressure profiles, a maximum drainage path (H_{dr}) length of 3.5 ft was determined. Lastly, for the purposes of the analysis for this project, a design coefficient of consolidation of 0.08 ft²/day was assumed.

3 Geotechnical Engineering Analysis

This section discusses the following geotechnical engineering analyses prepared in support of the remedial design (RD):

- Dredge prism side slope stability
- Bank excavation slope stability
- Cap bearing capacity and settlement

3.1 General Dredge Prism Side Slope Stability

The stability of dredge prism side slopes was evaluated using Rocscience Slide2 limit equilibrium software. An assumed dredge cut slope and sediment properties (Table C2-2) were input to the model, and a search routine was run by the software to locate the “critical” slip surface: the surface with the lowest factor of safety. The limit equilibrium method compares stresses (loads) and strength (resistance) for each slip surface to compute a factor of safety (Table C3-1). The calculation method (General Limit Equilibrium) satisfies both force and moment equilibrium for the slip surface.

Stability was evaluated for existing slopes and a range of potential dredge slopes for both short-term (undrained) and long-term (drained) conditions. Short term conditions represent the stability of slopes during construction. Long term conditions represent the stability of slopes after construction has been completed and soil/sediment has equilibrated to any new stress conditions associated with the post-construction slope geometry.

Based on bathymetric survey conducted during the Pre-Design Investigation, the natural angles of the subtidal to nearshore slopes range from 4H:1V to 17.5H:1V.

The slope stability evaluation was conducted for two different assumed slope cut angles (2H:1V and 3H:1V) and assuming water levels that correspond to both intertidal and subtidal slopes. For the subtidal evaluation, the dredge cut slope was assumed to be entirely submerged. For the intertidal evaluation, the water level was assumed to be 2 ft below the top of the dredge cut slope.

**Table C3-1
Factor of Safety Summary for Dredge Cut Slope Stability**

Dredge Cut Thickness (ft)	Scenario	Target Factor of Safety	Side Slope	Factor of Safety	
				Subtidal Slope	Intertidal Slope ¹
5	Short term	1.3	2H:1V	2.7	1.1
			3H:1V	3.4	1.4
5	Long term	1.5	2H:1V	1.1	NA
			3H:1V	1.6	NA
7	Short term	1.3	2H:1V	2.3	1.1
			3H:1V	2.8	1.4
7	Long term	1.5	2H:1V	1.0	NA
			3H:1V	1.6	NA

Notes:

1. Intertidal dredge areas will be backfilled in the long-term condition in accordance with the ROD; thus, there is no long-term intertidal slope condition created by dredging.

NA: not applicable

ROD: Record of Decision

In the short-term condition (i.e., during construction), temporary cut slopes of 2H:1V meet the target factor of safety in subtidal areas. In intertidal areas, 2H:1V short-term slopes have a factor of safety that is less than the target but greater than 1.0, suggesting that steeper temporary cut slopes have a greater risk of slope movement in intertidal areas during construction. This risk will be mitigated by the fact that intertidal areas will be backfilled after dredging, in accordance with ROD requirements, which will stabilize the area dredged.

Long-term slopes constructed at 2H:1V do not meet target factors of safety for subtidal dredged slopes. Long-term subtidal slopes constructed at 3H:1V do meet target factors of safety. In intertidal areas, dredge cut slopes will be backfilled, so there is no need to assess long-term dredge cut stability in these areas.

Based on the slope stability evaluation, short-term dredge cut slopes of 2H:1V can be used for the temporary scenario prior to backfilling. For long-term dredge cut slopes (i.e., areas that will not be backfilled), 3H:1V slopes should be used.

3.2 Bank Excavation Slope Stability

3.2.1 General Bank Slope Stability Considerations

In most locations along the banks of the upper reach, bank excavations will require removal of surficial soils or sediment. Where excavations on banks are on the order of 1 to 2 feet deep, the evaluation of bank excavation slope stability is not warranted because removal of thin cuts will not materially affect the stability of the bank itself. Experience conducting similar work on other shoreline projects has demonstrated that minor bank excavations (1 to 2 ft deep) can be accomplished without causing slope stability problems.

Bank slope stability is a key consideration for areas where deeper cuts are required at the toe of a bank area or on the bank itself. In these situations the deeper cut can undermine the toe of the bank and can potentially cause slope instability if not accounted for in the design. For 30% RD, one bank area meets the criteria for a location-specific bank slope stability evaluation – the South Park Marina. The stability of other intertidal banks will be evaluated in more detail, if appropriate, during 60% RD after shoreline dredge prisms are refined.

3.2.2 South Park Marina

For 30% RD, the stability of the bank at South Park Marina was evaluated to determine whether dredging at the toe of slope could increase the risk of slope movement. The slope in this area is reported to be marginally stable (Philip Spadaro, personal communication, May 2, 2022); slope stability issues have occurred during previous shoreline work.

The stability of the bank slope in the South Park Marina where RAL Exceedance Area 13 is located was modeled using limit equilibrium methods. Both short-term and long-term conditions were assessed for the existing slope configuration and for a post-dredge slope configuration assuming a 2H:1V dredge cut at the toe of slope, to a depth of -9 ft MLLW. Figure C3-1 depicts the cross section that was evaluated and shows the critical slip surface identified in the model results for the long-term condition for both the pre-dredge and post-dredge conditions. The slope stability modeling identified the following considerations for RD:

- The long-term factor of safety for the existing slope configuration is marginally higher than 1.0. This conclusion is consistent with reports that the slope in this area is considered only marginally stable.
- The long-term factor of safety for the post-dredge configuration suggests that the dredging side slopes would be stable, but the overall slope would continue to be marginally stable with the same factor of safety (and same critical slip surface location) as the existing long-term condition.

- The short-term factor of safety (during construction) for the dredge cut assumed in Figure C3-1 has a factor of safety less than 1.0. This suggests that, for the modeling assumptions used, the dredge cut cannot be accomplished without destabilizing the slope.

Based on these considerations, the design of the dredge cut at Area 13, as assumed in Figure C3-1, will need to be refined.

One option in this area would be to develop an integrated remedy that includes any potential remediation of the uplands being performed during the same remedial construction in water. In this case, the geotechnical design assumptions would be revisited, and the slope stability reevaluated considering the geometry of the proposed integrated remedial approach. In this case, construction in the South Park Marina basin would occur on a separate timeline from other LDW upper reach remedial actions. Coordination of the cleanup at Area 13 with work in the adjacent uplands is further discussed in the body of the BODR.

If the sediment remediation proceeds prior to any additional upland/bank remediation there are several options to be considered for refining the design in this area:

- Flatten the dredge cut side slopes. This refinement alone may not be sufficient to achieve an acceptable short-term factor of safety.
- Offset the dredge cut sufficiently so that the dredge cut does not influence the short-term stability of the adjacent slope.
- Reduce the depth of required dredging in this area. Based on conversations with representatives of the South Park Marina, the marina is considering a reduced berth depth in this area to help mitigate issues associated with the marginally stable slope.
- Install temporary shoring, such as a sheetpile wall at the toe of slope. The dredge cut would likely need to be backfilled and the overall slope would continue to be marginally stable after the temporary shoring is removed.
- Collect additional subsurface geotechnical information on the slope in this area. The model currently assumes the slope beneath the riprap consists of recent sediments, which have relatively low undrained shear strength. If conditions in this area are better than assumed in the model, the slope stability factor of safety would improve. However, because this area has been observed to be marginally stable, it is not expected that additional data collection would significantly modify the modeling conclusions.

As described in BODR, further Agency coordination is needed to develop the preferred path forward for integrating in water and upland cleanup designs at the South Park Marina.

3.3 Cap Design Evaluation

This section describes the cap bearing capacity and subgrade settlement evaluations completed for the 30% RD of the upper reach sediment remedy. These bracketing level evaluations consider a range of potential cap thicknesses and will be updated, if needed, for 60% RD.

This section also describes the cap static stability evaluation. Seismic cap performance evaluations are discussed in Section 5.

3.3.1 Bearing Capacity

Bearing capacity caps were evaluated using methods described in Appendix C of the Assessment and Remediation of Contaminated Sediments (ARCS) Program, "Guidance for *In situ* Subaqueous Capping of Contaminated Sediments" (Palermo et al. 1998). When cap material is placed on the surface of soft sediments, there is the potential for a bearing capacity failure directly through the *in situ* sediment. The initial cap lift thickness must be thin enough to maintain an acceptable factor of safety under the new loading caused by the weight of the cap.

In typical foundation design problems, a factor of safety of 3.0 is used for calculations wherein there is the potential for structural damage or impacts on human safety. This is the suggested factor of safety presented in the ARCS guidance. However, experience on other capping projects has shown that a factor of safety of 3.0 can be overly conservative when considering cap construction lift thickness. Because life safety and structural foundation stability are not design considerations for caps, and because slope stability evaluations use similar factors of safety, a factor of safety of 1.5 was considered appropriate for use in this analysis for evaluating the cap bearing capacity. Subaquatic cap placement has been successfully demonstrated at multiple sites when designed using a bearing capacity factor of safety of 1.5.

This analysis evaluates the steady-state, short-term stability of the cap and soft sediments during construction. Once the cap has been placed, consolidation of fine-grained *in situ* sediments will occur, increasing the shear strength of the sediment. Thus, the long-term stability of the cap against bearing capacity failure will be greater than the short-term stability.

The *in situ* sediments must have sufficient internal strength to prevent local shear failure. To evaluate this condition, the ultimate bearing capacity was calculated with the Terzaghi equations for local failure (Palermo et al. 1998) using the undrained shear strengths described in Section 2.3.

$$q_{ult} = \left(\frac{2}{3}\right) s_u * N_c \quad (\text{Equation 3-1})$$

Where:

- q_{ult} = ultimate bearing capacity of sediment (psf)
- s_u = undrained shear strength of *in situ* sediments (psf)
- N_c = Bearing capacity factor (dimensionless) = 5.14 for continuous strip footing (Terzaghi and Peck 1967)

This equation applies to a cap placed on the surface of an entirely cohesive soil with an angle of internal friction, ϕ' , equal to zero. For the caps placed in the upper reach, it is assumed that at least 2 ft of dredging would be performed before cap placement. Therefore, the shear strength at the 3-ft depth interval is considered appropriate for evaluating cap bearing capacity. Based on the shear strength assumptions presented in Table C2-2, the undrained shear strength of recent sediments below the 2-ft depth interval is 86 psf.

The ultimate bearing capacity was calculated as follows:

$$q_{ult} = \left(\frac{2}{3}\right) 86 * 5.14 = 295 \text{ psf}$$

A factor of safety of 1.5 was used to compute the allowable bearing capacity:

$$q_{all} = \left(\frac{q_{ult}}{\text{FOS}}\right) \quad (\text{Equation 3-2})$$

Where:

- q_{all} = Allowable bearing capacity (psf)
- FOS = Factor of Safety = 1.5

$$q_{all} = \left(\frac{295}{1.5}\right) = 196 \text{ psf}$$

The initial cap lift thickness that could be supported by the lowest-strength *in situ* sediments at an appropriate factor of safety was calculated using the allowable bearing capacity and the following equation:

$$h = \left(\frac{q_{all}}{\gamma'} \right) \quad (\text{Equation 3-3})$$

Where:

h	=	lift thickness
γ'	=	buoyant unit weight of cap material (pcf)
γ'	=	$\gamma - \gamma_w$
γ	=	total unit weight of cap material (pcf)
γ_w	=	unit weight of water (64 pcf)
γ'	=	110 pcf – 64 pcf = 46 pcf

$$h = \frac{196 \text{ psf}}{46 \text{ pcf}} = 4.2 \text{ feet} \approx 48 \text{ inches}$$

This analysis, which uses the minimum *in situ* shear strength selected for modeling, indicates a cap of 48 in. can be placed while maintaining an appropriate factor of safety for sediment bearing capacity during construction, assuming a dredge depth of 2 ft prior to capping. In this configuration, the post cap surface would project 2 feet above the pre-construction ground surface.

Caps and backfill will generally be constructed to match existing grade and not project above the pre-construction ground surface. However, this evaluation indicates that caps could still project above the pre-construction surface (up to 2 feet) while maintaining an appropriate factor of safety. The 30% RD does not identify the need for caps that project more than 2 feet above the pre-construction ground surface. If such conditions are identified during 60 or 90% RD, the bearing capacity evaluation will be revisited and, if necessary, measures to control lift placement will be defined for inclusion in the project specifications.

3.3.2 Subgrade Consolidation Settlement

Subgrade consolidation beneath the load imposed by a cap was assessed for two different scenarios. In Scenario 1, the constructed cap would be placed after dredging, and the post-cap grade would be the same as the pre-dredge mudline elevation. The new loads imposed on the subgrade would be caused by the greater unit weight of cap material than the *in situ* unit weight of the sediments that would have been dredged. Scenario 1, developed to reflect the ROD requirements for capping, would apply most of the time that caps would be used.

Scenario 2 reflects the use of caps where dredging would be limited (e.g., to protect structures). The top of cap would be at a higher elevation than the original pre-dredge mudline, so new loads would also be caused by additional cap material placed above the pre-dredge mudline elevation.

Both scenarios assume a 4-ft-thick cap. In Scenario 1, 4 ft of dredging is assumed. In Scenario 2, 2 ft of dredging is assumed prior to cap placement. Two different *in situ* sediment thicknesses were evaluated to bracket the range of predicted settlement. Table C3-2 summarizes the scenarios evaluated for subgrade consolidation.

**Table C3-2
Subgrade Consolidation Modeling Scenarios**

Scenario	Pre-Dredge Sediment Thickness (ft)	Dredge Depth (ft)	Post Dredge Sediment Thickness (ft)	Cap Thickness (ft)	Net Stress Increase (psf) ¹
1a	7	4	3	4	40
1b	15	4	11	4	40
2a	7	2	3	4	240
2b	15	2	11	4	240

Notes:

1. Assumes cap imposes total unit weight (above the water line) on the subgrade.
psf: pounds per square foot

Subgrade consolidation was calculated according to the following relationship:

$$\Delta H = H \times CR \times \log \left(\frac{\sigma'_{vo} + \Delta\sigma'_v}{\sigma'_{vo}} \right) \quad (\text{Equation 3-4})$$

Where:

- ΔH = consolidation settlement
- H = consolidating layer thickness
- CR = compression ratio of subgrade sediment (Table C2-2)
- σ'_{vo} = *in situ* vertical effective stress
- $\Delta\sigma'_v$ = net stress increase (Table C3-2)

Table C3-3 summarizes the results of the subgrade consolidation evaluation.

**Table C3-3
Subgrade Consolidation Summary**

Scenario	Estimated Consolidation Settlement (in.)
1a	2
1b	3
2a	5
2b	10

As shown in Table C3-3, the subgrade in dredge and cap areas is predicted to settle approximately 2 to 3 in. after cap placement. Where caps are placed to a final elevation that is 2 ft above the pre-dredge mudline, a range of subgrade settlement of 5 to 10 in. is predicted.

The time rate over which consolidation occurs is a function of the distance porewater must travel (drainage path length) and the coefficient of consolidation of the subgrade. Time rate of consolidation was evaluated according to the following equation:

$$T = \frac{c_v t}{H_{DR}^2} \quad (\text{Equation 3-5})$$

Where:

- T = time factor = 0.8 for 90% consolidation (Lambe and Whitman 1969)
- c_v = coefficient of consolidation (Section 2.3)
- t = time to achieve 90% consolidation
- H_{DR} = drainage path length (Section 2.3)

Based on Equation 3-5, it is estimated that subgrade consolidation would be 90% complete approximately 120 days after cap construction.

Subgrade consolidation settlement can confound the interpretation of bathymetric survey results if bathymetry surveys are used to confirm the thickness of caps. When subgrade consolidation settlement occurs, bathymetry comparisons (i.e., isopach mapping) can be incorrectly interpreted as indicating "thinning" of cap material. Therefore, supplemental cap confirmation approaches such as thickness probing will also be included in LTTMP planning to address potential issues associated with subgrade consolidation.

3.3.3 Static Slope Stability of Caps

The 30% RD for the upper reach includes the potential need for a cap along the shoreline at RAL exceedance area 18. The cap would be placed following dredging, resulting in a cap surface that generally matches the pre-construction grade in this area. This section describes the static slope stability evaluation of caps placed at RAL exceedance area 18.

Cap slope stability was evaluated using limit equilibrium methods. A geologic profile was developed using soil and sediment geotechnical engineering parameters presented in Table C2-2. The modeling software was set to search for the critical slip surface for any location along the slope on the water side of the bulkhead along RAL exceedance area 18.

Figure C3-2 presents the geologic profile and depicts the critical slip surface and factor of safety. The factor of safety for the cap is 2.25, which is greater than the target long term factor of safety of 1.5, indicating acceptable static slope stability for caps.

3.4 Backfill Design

Backfill will be placed in habitat areas (elevations greater than -10 ft MLLW) in accordance with the ROD. In some dredge areas, backfill may need to be sloped below elevation -10 ft MLLW until it meets the post-dredge surface at depth. This section presents the evaluation of stable backfill slope angles to support the backfill grading design.

Backfill slope stability was evaluated using infinite slope stability theory, in accordance with Duncan and Wright (2005). For this evaluation, the factor of safety for a 3H:1V backfill slope was computed using the following equation:

$$FOS = \frac{\tan(\phi')}{\tan(i)} \quad (\text{Equation 3-6})$$

Where:

FOS	=	<i>factor of safety</i>
ϕ'	=	backfill friction angle (Table C2-2)
i	=	slope angle

The factor of safety for backfill placed at a 3H:1V slope is 1.9, which is greater than the target long-term slope stability factor of safety. Thus a 3H:1V slope angle should be used for the design of backfill slopes.

Where steeper slopes may be needed, armor rock could be used to protect the backfill surface. Shoreline armor has a higher friction angle than sand and gravel backfill and is typically assumed to range from 38 to 42 degrees for angular rock (USDA 1989). Assuming an armor rock friction angle of

38 degrees, slopes of 2H:1V have a factor of safety of 1.6, which is greater than the minimum long-term factor of safety of 1.5. Thus backfill can be placed on 2H:1V slopes if angular armor rock is used.

4 Geotechnical Engineering Recommendations to Support Structural Engineering Evaluations

This section presents geotechnical engineering recommendations to support structural evaluations of vertical structures such as bulkheads and bridge piers, and to design replacement piles that may be needed as part of remedy construction in the upper reach. Necessary structural engineering evaluations will be presented at 60% based in part on the recommendations provided in this section.

4.1 Vertical Structure Evaluation Geotechnical Recommendations

This section provides recommendations for the structural engineer to use for the evaluation of existing vertical structures adjacent to RAL exceedance areas.

4.1.1 *Lateral Earth Pressures for Shoreline Structures*

The following lateral earth pressure recommendations are provided for structural evaluation of cantilevered shoreline bulkhead walls. This information can be used to assess the need for offsets or other measures if dredging needs to be performed in front of bulkheads.

Lateral earth pressures acting on the bulkhead will depend primarily on:

- Fill material placed behind the wall, and the degree of compaction immediately adjacent to the wall
- Flexibility of the wall, and the degree of movement that the wall undergoes
- The presence of any surcharges or concentrated loads adjacent to the bulkhead
- Wall drainage
- Seismic loading

If the bulkhead is permitted to yield such that the top can move laterally at least 0.1% of the bulkhead's retained height when loaded, active earth pressures will develop. If this level of deflection is intolerable, the wall should be evaluated using at-rest soil pressures.

To design for lateral earth pressures, the parameters provided in Table C4-1 should be used. Earth pressures may be computed assuming a triangular pressure distribution applied from the top of the bulkhead to the base of the sheeting. Passive pressures will also be applied in a triangular distribution, from the mudline downward.

**Table C4-1
Bulkhead Lateral Earth Pressure Parameters**

Parameter	Design Value
GWT behind bulkhead	6 ft MLLW
Upland soil effective unit weight above GWT	135 pcf
Upland soil effective unit weight below GWT	71 pcf
Upland soil effective friction angle (ϕ')	33 degrees
Upland soil cohesion c	0 psf
Waterway sediment effective unit weight above waterline	100 pcf
Waterway sediment effective unit weight below waterline	36 pcf
Waterway sediment effective friction angle (ϕ')	27 degrees
Waterway sediment cohesion (c)	0 psf
K_A – active pressure coefficient for upland soils – flexible walls	0.29
K_O – at rest pressure coefficient for upland soils – rigid walls	0.46
K_P – passive pressure coefficient for waterway sediments ¹	2.66

Notes:

1. Passive pressures are presented as ultimate values and do not include a factor of safety.

GWT: groundwater table elevation

MLLW: mean lower low weight

pcf: pounds per cubic foot

psf: pounds per square foot

As noted in Table C4-1, using the passive pressure coefficient provided would result in calculating ultimate passive soil resistance, which would be an appropriate assumption for calculating the potential reduction in passive resistance at the toe of the wall when dredging occurs.

4.1.2 Effect of Prohibiting Surcharge Loads above Bulkheads during Adjacent Dredging

Bulkheads retain soil loads and surcharges in the form of active or at rest lateral earth pressures. These earth pressures are resisted at the toe of bulkhead by passive earth pressures provided by the sediments in front of the bulkhead. The following discussion evaluates how much of the passive earth pressure is needed to resist surcharge loads alone, and the effect to prohibiting surcharge loads during dredging. This assessment was developed using generalized soil and sediment conditions and thus is applicable to structures throughout the upper reach.

It is assumed that shoreline bulkheads were designed and constructed to support temporary surcharge loads at the top of the bulkheads. Typically, a temporary surcharge of 250 psf (or higher) can be accommodated by marine shoreline structures in good condition. Assuming a bulkhead backfill unit weight of 135 pcf, 250 psf is effectively equivalent to a soil surcharge height of 1.85 ft.

One way to protect structures during adjacent dredging is to prohibit surcharge loading during dredging. This effectively allows for the "design surcharge capacity" of the wall to be used to offset the temporary loss of passive pressure in front of the wall due to dredging.

The bulkhead adjacent to the Port of Seattle Sliver Property at Area 18 currently has a retained soil height of approximately 15 ft. The active lateral earth pressure behind the wall (no surcharge) is calculated as follows:

$$P_A = \frac{1}{2} K_A \gamma h^2 \quad (\text{Equation 4-1})$$

Where:

P_A	=	Active earth pressure resultant force (lb/ft)
K_A	=	Active earth pressure coefficient for retained soil (Table C4-1)
γ	=	unit weight of retained soil (Table C4-1)
h	=	retained height of soil (ft)

For the Area 18 bulkhead, the resultant active earth pressure is calculated to be 4,400 lb/ft.

Adding 1.85 ft of retained height for the surcharge loading condition (equivalent to a retained soil height of 16.85 ft), the active lateral earth pressure is calculated to be 5,560 lb/ft, which means that prohibiting surcharge during dredging could offset the loss of 1,160 lb/ft of passive pressure.

Passive earth pressure is calculated as follows:

$$P_P = \frac{1}{2} K_P \gamma d^2 \quad (\text{Equation 4-2})$$

Where:

P_P	=	passive earth pressure resultant force (lb/ft)
K_P	=	passive earth pressure coefficient for sediments (Table C4-1)
γ	=	unit weight of sediments (Table C4-1)
d	=	depth below mudline (ft)

For the passive pressure coefficients for sediments presented in Table C4-1, a depth of approximately 5 ft below mudline is required to achieve a passive pressure of 1,160 lb/ft when sediments are submerged (buoyant unit weight providing passive pressure), or approximately 3 ft below mudline when sediments are not submerged (total unit weight providing passive pressure).

Based on this evaluation, for shoreline bulkheads in good condition that were designed to support an upland surcharge of at least 250 psf, prohibiting surcharges during dredging would allow for 3 to 5 ft of dredging to occur while maintaining passive pressure support comparable to the surcharge loading condition with no dredging.

Note that this assessment considers the soil loads only and does not account for the condition of the bulkhead wall, nor the stresses in the wall structure that might be imposed by removing passive support during dredging.

4.1.3 *Effect of Dredging on Passive Pressure*

As previously discussed, dredging adjacent to structures reduces passive pressure, which can increase the loads on the structure. This section describes the evaluations performed to determine appropriate reductions in passive pressure considering the following:

- Dredge cut slope angle
- Dredge cut depth
- Horizontal offset of dredge cut from the structure

The analyses presented in this section were developed specific to the Recent Sediment material that would be removed by dredging and is applicable to any vertical structure in the upper reach (e.g., bulkheads, bridge piers, etc.). To conduct this analysis, the total available passive pressure (no dredging) was compared to the weight of the passive wedge that would remain after dredging. The reduction factor was calculated as follows:

$$\text{Reduction Factor} = \frac{W_w}{P_R} \quad (\text{Equation 4-3})$$

Where:

W_w = Buoyant weight of passive soil wedge between structure and toe of dredge cut (lb/ft)

P_R = Passive earth pressure force for the no dredging scenario calculated at the evaluated depth of dredging (lb/ft).

Offsets of 0, 2, and 4 ft from the structure were considered. A range of dredge depths from 5 to 15 ft deep was evaluated. Dredge cut side slopes of 2H:1V, 1.5H:1V, and 1H:1V were assessed.

Key conclusions from this evaluation, in the form of passive earth pressure reduction factors, are presented in Table C4-2.

**Table C4-2
Passive Earth Pressure Reduction Factors**

Offset Distance	Reduction Factor		
	2H:1V	1.5H:1V	1H:1V
0	0.75	0.56	0.38
2	0.85	0.66	0.48
4	0.95	0.76	0.58

As shown in Table C4-2, when the dredge prism is not offset, the passive earth pressure could be significantly reduced, particularly if the dredge cut is oversteepened beyond the recommended 2H:1V temporary cut slope. Reduced passive pressure increases the risk of damaging structures.

Based on this evaluation, a minimum horizontal dredging offset of 5 ft is recommended to minimize the potential for reduced passive earth pressure. The reduction factors presented in Table C4-2, in conjunction with the earth pressure recommendations in Table C4-1, can be used by the structural engineer to determine whether any structures can tolerate a dredging offset that is closer than 5 ft.

4.2 Pile Design Recommendations

Piles are anticipated to be removed at the South Park Marina floats and the timber groins near the in RAL exceedance areas 32-35 may need to be demolished so that remediation can be accomplished unimpeded in these areas. There may also be miscellaneous single piles or dolphin pile groups that need to be removed to accomplish construction. This section presents geotechnical engineering pile design recommendations for the structural engineer's use in designing replacement piles.

Based on discussion with the project structural engineer, replacement piles are likely to be hollow steel pipe piles, which lend themselves to vibratory installation and are capable of supporting the range of loads anticipated for this project.

Replacement piles for the South Park Marina floats and the RAL exceedance areas 32-35 timber groins are expected to be primarily laterally loaded. Replacement piles that support vertical loads are not expected to be needed for the upper reach. If such a need arises during 60% or 90% RD, the geotechnical recommendations will be updated to provide vertical compressive and uplift capacity estimates specific to the pile size(s) anticipated and the location(s) where they would be installed.

Pile design to resist lateral loads can be accomplished using L-PILE or similar software to assess pile deflection under loading and required depth to fixity below the mudline. Table C4-3 presents recommended L-PILE parameters to model the recent sediments and alluvium. Table C4-4 presents recommended mudline elevations and sediment unit thickness for pile design assessments at the South Park Marina floats and near the RAL exceedance areas 32-35 timber groins. Note that the South Park Marina recommendations in Table C4-4 do not reflect current conditions—the elevations and thicknesses assume future maintenance dredging will be performed in the vicinity of the floats. This assumption for the South Park Marina will result in conservative embedment depths such that piles will perform as intended even if dredging is not performed.

The need for replacement piles at other locations may be identified during 60% RD. If additional areas require replacement piles, the recommendations in Table C4-4 will be updated accordingly.

**Table C4-3
L-PILE Modeling Parameters**

Layer	Effective Unit Weight γ' (pcf)	Friction Angle ϕ (°)	Undrained Shear Strength c_u (kip/ft ²)	P-Y Curve Model	Spring Constant; K ($E_s=Kx$) k (pci)	Strain Factor; @50% max E ϵ_{50}
Recent sediment	36	27	0.08	Soft clay (Matlock)	--	0.020
Alluvium	61	32	--	Sand (Reese)	20	--

**Table C4-4
Mudline Elevations and Sediment Unit Thicknesses for Lateral Pile Design**

Location	Design Mudline Elevation for Replacement Piles (ft MLLW)	Recent Sediment Unit Thickness (ft)	Contact Elevation between Recent Sediments and Alluvium (ft MLLW)
South Park Marina floats	Note 1	9	-12
RAL exceedance area 32-35 timber groins ^{2,3}	-8 to +6	2	-3 to -8

Notes:

1. The design mudline elevation will be determined during 60% RD in coordination with the South Park Marina owner.
2. Mudline elevations based on inspection of surveyed groin locations and existing bathymetry. Replacement groins intended to be installed in similar locations and over similar elevation ranges as existing groins.
3. Other options for the timber groins will be evaluated during 60% RD. For example, localized sediment removal may be possible without complete demolition and replacement of the groins

MLLW: mean lower low water

5 Seismic Design

The upper reach is located within the seismically active Puget Lowland, a region characterized by bedrock faults and tectonic plate movement and that has a documented history of earthquake activity. Earthquakes occur when energy accumulated during fault or tectonic plate movement is suddenly released over a short time span. The location of energy release, known as the epicenter of an earthquake, can occur at different places in a fault system.

The ground shaking caused by an earthquake can cause loose soils to lose strength as porewater pressure increases. This phenomenon, known as liquefaction, can cause soil movement and ground settlement. Earthquakes can also shake structures and impose loads on structural elements and foundations. Seismic risks are assessed in geotechnical engineering using a variety of tools.

This section describes the seismic design of the sediment remedy for the upper reach with a focus on the anticipated performance of remedial elements (primarily sediment caps) under earthquake loading. This section also provides recommended seismic design parameters for use by the structural engineer, as appropriate.

5.1 Seismic Site Class

Seismic behavior is generally assessed by evaluating the relative density of near-surface soils (the upper 100 ft below ground surface). For seismic design, relative density is often characterized by the average shear wave velocity of the soil column, which governs how earthquake energy is amplified or dampened by the near-surface soils. A Washington State-wide study by Cakir and Walsh (undated) summarized measurements of shear wave velocity at different sites across the state, including three locations in the Duwamish River basin near the upper reach. This study identified a typical seismic site class between Class D and Class E based on average shear wave velocities between 131 and 183 meters per second for the Duwamish River area in the vicinity of the upper reach.

5.2 Strong Motion Design Input Parameters

For seismic evaluations, earthquake peak ground acceleration (presented as a percentage of the force of gravity [g]) and earthquake magnitude are key input parameters.

The U.S. Geological Survey (USGS) provides internet-based tools that, using mapped locations and seismic site classes, output peak ground accelerations and earthquake magnitudes for different recurrence interval earthquakes.

For the upper reach sediment remedy, two different earthquake types were considered:

- A 100-year recurrence interval earthquake, consistent with typical protectiveness evaluations for other remedy elements such as cap contaminant modeling
- A 475-year recurrence interval earthquake, which has traditionally been the size of event considered on other regional Superfund projects based on a 10% probability of exceedance in a 50-year time frame.

Table C5-1 provides the key USGS output parameters used for geotechnical seismic assessment for both events.

**Table C5-1
Earthquake Parameters used in Geotechnical Engineering Evaluations**

Event Recurrence Interval	PGA (% gravity)	Mean Magnitude
100 years	0.19	6.7
475 years	0.41	7.0

 2. Site Class D/E; Dynamic Conterminous United States model (2014 edition v4.2.0)
 3. Model source: <https://earthquake.usgs.gov/hazards/interactive>
- PGA: peak ground acceleration

5.3 Liquefaction Evaluation

As described in Section 2, the site investigation included CPTs at 20 different locations in the upper reach. Digital records from these CPTs were processed by the analytical software Cliq (version 3.3.1.14), which facilitates liquefaction assessment and estimates of liquefaction-induced settlement using CPT measured parameters, earthquake peak ground accelerations, and earthquake magnitude.

For all locations investigated with a CPT, liquefaction was predicted during both the 100- and 475-year earthquakes. The estimated magnitude of liquefaction-induced settlement did not significantly vary between the two earthquakes, ranging from 3 to 14 (median 7) in. of settlement in the upper 30 ft below ground surface.

5.4 Seismic Performance of Capped Slopes

The seismic performance of capped slopes was evaluated using limit equilibrium methods, as described for the slope stability discussions in Section 3. A geologic cross section of the slope at Area 18 was modeled, and seismic forces associated with both the 100- and 475-year earthquakes

were added. For the 475-year earthquake, the resulting factor of safety was less than 1.0, indicating that some movement of the capped slope can be expected during a significant earthquake. For the 100-year earthquake, the factor of safety was 1.05. Figure C5-1 depicts the cross section evaluated, as well as the critical slip surface and factors of safety for both the 100-year and 475-year earthquakes. If other areas are identified during 60% RD that will require caps on slopes, this evaluation will be updated to include those areas.

In general, shoreline slopes are susceptible to movement during strong earthquake shaking. Slopes designed to resist movement could require significant structural reinforcement that is not compatible with the habitat and human uses of shorelines. In light of these issues, the geotechnical engineering community is moving toward a performance-based assessment of slopes, when appropriate, for seismic design. In the case of shoreline slopes where life safety and structures are not at risk, this type of assessment does not attempt to design for preventing movement; rather a performance-based approach evaluates how much movement could be expected during an earthquake and what mitigation measures, if any, would need to be implemented after the earthquake had occurred.

Slope displacement was estimated for both the 100- and 475-year earthquakes in accordance with the methods presented in NCHRP (2008). Table C5-2 presents the estimated slope displacement for a proposed cap at Area 18 under both earthquake scenarios.

**Table C5-2
Seismic Slope Displacement for Area 18 Caps**

Earthquake Return Interval	Estimated Displacement
100 years	1 to 2 in.
475 years	1 to 2 ft

5.5 Conclusions on Seismic Performance of Sediment Remedy

Based on the liquefaction assessment and slope displacement estimates, the sediment remedy is expected to have acceptable seismic performance. Anticipated settlement and displacement under the 100-year event is expected to be significantly less than proposed cap thicknesses. During a larger earthquake, the cap may move down the slope, but it is not expected to be breached.

Post-earthquake mitigation measures could include visual inspections and bathymetry surveys to evaluate cap condition. Cap repairs, if needed, could be readily implemented by adding more cap substrate to address any local thinning associated with post-earthquake deformation or settlement.

The LTMMMP will consider these evaluations and set criteria for inspections following seismic events.

DESCRIPTION: Den., moist., color, minor, MAJOR CONSTITUENT, NON-SOIL SUBSTANCES: Odor, staining, sheen, scrag, slag, etc.

(0 to 0.2 ft.) ML. organic SILT, roots

(0.2 to 1.5 ft.)ML. very soft, moist, grey, SILT. Contains occasional organics and brick pieces (fill) <0.5 inches

(1.5 to 2.3 ft.)SP. loose, moist, grey, SAND, medium grained.

End of Boring @ 2.3 feet

Notes:

PRESENTATION OF SITE INVESTIGATION RESULTS

LDW Phase 3

Prepared for:

Anchor QEA

ConeTec Job No: 21-59-22445

Project Start Date: 06-JUL-2021

Project End Date: 29-JUL-2021

Report Date: 9-AUG-2021

Prepared by:

ConeTec Inc.
1508 O Street SW, Unit 103-104
Auburn, WA 98001

Tel: (253) 397-4861

ConeTecWA@conetec.com
www.conetec.com
www.conetecdataservices.com

Introduction

The enclosed report presents the results of the site investigation program conducted by ConeTec Inc. for Anchor QEA along mile 3-5 of the Duwamish River located in Seattle WA. The program consisted of cone penetration tests, full flow penetration tests & electronic vane testing

Project Information

Project	
Client	Anchor QEA
Project	LDW Phase 3
ConeTec project number	21-59-22445

An aerial overview from Google Earth including the CPTu test locations is presented below.

Rig Description	Deployment System	Test Type
C05-023 Track Rig	Integrated Push System	CPT, BCPT, VST
A07-018 Amphibious Rig	Integrated Push System	CPT
Barge Support	Auxiliary Push Boat	CPT, BCPT, VST

Coordinates			
Test Type	Collection Method	EPSG Number	Comments
CPT, BCPT, VST	Client provided	4326	Coordinates converted from State Plane

Cone Penetrometers Used for this Project						
Cone Description	Cone Number	Cross Sectional Area (cm ²)	Sleeve Area (cm ²)	Tip Capacity (bar)	Sleeve Capacity (bar)	Pore Pressure Capacity (bar)
681:T375F10U35	681	15	225	375	10	35
Cone 681 was used for all CPTu soundings.						

Cone Penetration Test (CPTu)	
Depth reference	Depths are referenced to the existing mudline at the time of each test.
Tip and sleeve data offset	0.1 meter This has been accounted for in the CPT data files.
Additional plots	<ul style="list-style-type: none"> Advanced plots with I_c, S_u, ϕ and $N1(60)$ Soil Behaviour Type (SBT) scatter plots
Additional comments	A negative water table has been applied to all soundings completed from barge deck. All CPT data files begin at mudline (mudline = 0.0ft)

Calculated Geotechnical Parameter Tables	
Additional information	<p>The Normalized Soil Behaviour Type Chart based on Q_{tn} (SBT Q_{tn}) (Robertson, 2009) was used to classify the soil for this project. A detailed set of calculated CPTu parameters have been generated and are provided in Excel format files in the release folder. The CPTu parameter calculations are based on values of corrected tip resistance (q_t) sleeve friction (f_s) and pore pressure (u_2).</p> <p>Effective stresses are calculated based on unit weights that have been assigned to the individual soil behaviour type zones and the assumed equilibrium pore pressure profile.</p>

Full-Flow Cone Penetration Test (BCPTu)	
Depth reference	All soundings were started slightly above the mudline in the water column. Mudline is clearly indicated on all plots and clearly visible within the data set.
Unit weight profiles	<ul style="list-style-type: none"> A unit weight of 62.43pcf was applied to data collected within the water column above mudline A unit weight of 111.37pcf was applied to data collected below mudline <p>The unit weight is clearly indicated in the data set.</p>

Electric Field Vane Shear Test (VST)	
Depth reference	Depths are referenced to depth below mudline at the time of each test
Load cell capacity	100 N·m
Load cell location	Uphole
Additional comments	All vane tests were completed from the floating barge platform. The vane test results were affected by barge movement from local waves, local vessel traffic and river flow. Additionally, the vane results were susceptible to elevation change from either rising or falling tide. Over the course of a vane test the barge would gain/lose approximately 2"-4" of elevation due to tidal effects.

Limitations

This report has been prepared for the exclusive use of Anchor QEA (Client) for the project titled "LDW Phase 3". The report's contents may not be relied upon by any other party without the express written permission of ConeTec Inc. (ConeTec). ConeTec has provided site investigation services, prepared the factual data reporting and provided geotechnical parameter calculations consistent with current best practices. No other warranty, expressed or implied, is made.

The information presented in the report document and the accompanying data set pertain to the specific project, site conditions and objectives described to ConeTec by the Client. In order to properly understand the factual data, assumptions and calculations, reference must be made to the documents provided and their accompanying data sets, in their entirety.

Cone penetration tests (CPTu) are conducted using an integrated electronic piezocone penetrometer and data acquisition system manufactured by Adara Systems Ltd., a subsidiary of ConeTec.

ConeTec's piezocone penetrometers are compression type designs in which the tip and friction sleeve load cells are independent and have separate load capacities. The piezocones use strain gauged load cells for tip and sleeve friction and a strain gauged diaphragm type transducer for recording pore pressure. The piezocones also have a platinum resistive temperature device (RTD) for monitoring the temperature of the sensors, an accelerometer type dual axis inclinometer and two geophone sensors for recording seismic signals. All signals are amplified and measured with minimum sixteen-bit resolution down hole within the cone body, and the signals are sent to the surface using a high bandwidth, error corrected digital interface through a shielded cable.

ConeTec penetrometers are manufactured with various tip, friction and pore pressure capacities in both 10 cm² and 15 cm² tip base area configurations in order to maximize signal resolution for various soil conditions. The specific piezocone used for each test is described in the CPT summary table presented in the first appendix. The 15 cm² penetrometers do not require friction reducers as they have a diameter larger than the deployment rods. The 10 cm² piezocones use a friction reducer consisting of a rod adapter extension behind the main cone body with an enlarged cross sectional area (typically 44 millimeters diameter over a length of 32 millimeters with tapered leading and trailing edges) located at a distance of 585 millimeters above the cone tip.

The penetrometers are designed with equal end area friction sleeves, a net end area ratio of 0.8 and cone tips with a 60 degree apex angle.

All ConeTec piezocones can record pore pressure at various locations. Unless otherwise noted, the pore pressure filter is located directly behind the cone tip in the "u₂" position ([ASTM Type 2](#)). The filter is six millimeters thick, made of porous plastic (polyethylene) having an average pore size of 125 microns (90-160 microns). The function of the filter is to allow rapid movements of extremely small volumes of water needed to activate the pressure transducer while preventing soil ingress or blockage.

The piezocone penetrometers are manufactured with dimensions, tolerances and sensor characteristics that are in general accordance with the current [ASTM D5778](#) standard. ConeTec's calibration criteria also meets or exceeds those of the current [ASTM D5778](#) standard. An illustration of the piezocone penetrometer is presented in [Figure CPTu](#).

Figure CPTu. Piezocone Penetrometer (15 cm²)

The ConeTec data acquisition systems consist of a Windows based computer and a signal interface box and power supply. The signal interface combines depth increment signals, seismic trigger signals and the downhole digital data. This combined data is then sent to the Windows based computer for collection and presentation. The data is recorded at fixed depth increments using a depth wheel attached to the push cylinders or by using a spring loaded rubber depth wheel that is held against the cone rods. The typical recording interval is 2.5 centimeters; custom recording intervals are possible.

The system displays the CPTu data in real time and records the following parameters to a storage media during penetration:

- Depth
- Uncorrected tip resistance (q_c)
- Sleeve friction (f_s)
- Dynamic pore pressure (u)
- Additional sensors such as resistivity, passive gamma, ultra violet induced fluorescence, if applicable

All testing is performed in accordance to ConeTec's CPTu operating procedures which are in general accordance with the current [ASTM D5778](#) standard.

Prior to the start of a CPTu sounding a suitable cone is selected, the cone and data acquisition system are powered on, the pore pressure system is saturated with silicone oil and the baseline readings are recorded with the cone hanging freely in a vertical position.

The CPTu is conducted at a steady rate of two centimeters per second, within acceptable tolerances. Typically one meter length rods with an outer diameter of 1.5 inches (38.1 millimeters) are added to advance the cone to the sounding termination depth. After cone retraction final baselines are recorded.

Additional information pertaining to ConeTec's cone penetration testing procedures:

- Each filter is saturated in silicone oil under vacuum pressure prior to use
- Baseline readings are compared to previous readings
- Soundings are terminated at the client's target depth or at a depth where an obstruction is encountered, excessive rod flex occurs, excessive inclination occurs, equipment damage is likely to take place, or a dangerous working environment arises
- Differences between initial and final baselines are calculated to ensure zero load offsets have not occurred and to ensure compliance with [ASTM](#) standards

The interpretation of piezocone data for this report is based on the corrected tip resistance (q_t), sleeve friction (f_s) and pore water pressure (u). The interpretation of soil type is based on the correlations developed by [Robertson et al. \(1986\)](#) and [Robertson \(1990, 2009\)](#). It should be noted that it is not always possible to accurately identify a soil behavior type based on these parameters. In these situations, experience, judgment and an assessment of other parameters may be used to infer soil behavior type.

The recorded tip resistance (q_c) is the total force acting on the piezocone tip divided by its base area. The tip resistance is corrected for pore pressure effects and termed corrected tip resistance (q_t) according to the following expression presented in [Robertson et al. \(1986\)](#):

$$q_t = q_c + (1-a) \cdot u_2$$

where: q_t is the corrected tip resistance

q_c is the recorded tip resistance

u_2 is the recorded dynamic pore pressure behind the tip (u_2 position)

a is the Net Area Ratio for the piezocone (0.8 for ConeTec probes)

The sleeve friction (f_s) is the frictional force on the sleeve divided by its surface area. As all ConeTec piezocones have equal end area friction sleeves, pore pressure corrections to the sleeve data are not required.

The dynamic pore pressure (u) is a measure of the pore pressures generated during cone penetration. To record equilibrium pore pressure, the penetration must be stopped to allow the dynamic pore pressures to stabilize. The rate at which this occurs is predominantly a function of the permeability of the soil and the diameter of the cone.

The friction ratio (R_f) is a calculated parameter. It is defined as the ratio of sleeve friction to the tip resistance expressed as a percentage. Generally, saturated cohesive soils have low tip resistance, high friction ratios and generate large excess pore water pressures. Cohesionless soils have higher tip resistances, lower friction ratios and do not generate significant excess pore water pressure.

A summary of the CPTu soundings along with test details and individual plots are provided in the appendices. A set of files with calculated geotechnical parameters were generated for each sounding based on published correlations and are provided in Excel format in the data release folder. Information regarding the methods used is also included in the data release folder.

For additional information on CPTu interpretations and calculated geotechnical parameters, refer to [Robertson et al. \(1986\)](#), [Lunne et al. \(1997\)](#), [Robertson \(2009\)](#), [Mayne \(2013, 2014\)](#) and [Mayne and Peuchen \(2012\)](#).

The cone penetration test is halted at specific depths to carry out pore pressure dissipation (PPD) tests, shown in Figure PPD-1. For each dissipation test the cone and rods are decoupled from the rig and the data acquisition system measures and records the variation of the pore pressure (u) with time (t).

Figure PPD-1. Pore pressure dissipation test setup

Pore pressure dissipation data can be interpreted to provide estimates of ground water conditions, permeability, consolidation characteristics and soil behavior.

The typical shapes of dissipation curves shown in Figure PPD-2 are very useful in assessing soil type, drainage, in situ pore pressure and soil properties. A flat curve that stabilizes quickly is typical of a freely draining sand. Undrained soils such as clays will typically show positive excess pore pressure and have long dissipation times. Dilative soils will often exhibit dynamic pore pressures below equilibrium that then rise over time. Overconsolidated fine-grained soils will often exhibit an initial dilatory response where there is an initial rise in pore pressure before reaching a peak and dissipating.

Figure PPD-2. Pore pressure dissipation curve examples

In order to interpret the equilibrium pore pressure (u_{eq}) and the apparent phreatic surface, the pore pressure should be monitored until such time as there is no variation in pore pressure with time as shown for each curve in [Figure PPD-2](#).

In fine grained deposits the point at which 100% of the excess pore pressure has dissipated is known as t_{100} . In some cases this can take an excessive amount of time and it may be impractical to take the dissipation to t_{100} . A theoretical analysis of pore pressure dissipations by [Teh and Houlsby \(1991\)](#) showed that a single curve relating degree of dissipation versus theoretical time factor (T^*) may be used to calculate the coefficient of consolidation (c_h) at various degrees of dissipation resulting in the expression for c_h shown below.

$$c_h = \frac{T^* \cdot a^2 \cdot \sqrt{l_r}}{t}$$

Where:

- T^* is the dimensionless time factor ([Table Time Factor](#))
- a is the radius of the cone
- l_r is the rigidity index
- t is the time at the degree of consolidation

Table Time Factor. T^* versus degree of dissipation ([Teh and Houlsby \(1991\)](#))

Degree of Dissipation (%)	20	30	40	50	60	70	80
$T^* (u_2)$	0.038	0.078	0.142	0.245	0.439	0.804	1.60

The coefficient of consolidation is typically analyzed using the time (t_{50}) corresponding to a degree of dissipation of 50% (u_{50}). In order to determine t_{50} , dissipation tests must be taken to a pressure less than u_{50} . The u_{50} value is half way between the initial maximum pore pressure and the equilibrium pore pressure value, known as u_{100} . To estimate u_{50} , both the initial maximum pore pressure and u_{100} must be known or estimated. Other degrees of dissipations may be considered, particularly for extremely long dissipations.

At any specific degree of dissipation the equilibrium pore pressure (u at t_{100}) must be estimated at the depth of interest. The equilibrium value may be determined from one or more sources such as measuring the value directly (u_{100}), estimating it from other dissipations in the same profile, estimating the phreatic surface and assuming hydrostatic conditions, from nearby soundings, from client provided information, from site observations and/or past experience, or from other site instrumentation.

For calculations of c_h ([Teh and Houlsby \(1991\)](#)), t_{50} values are estimated from the corresponding pore pressure dissipation curve and a rigidity index (l_r) is assumed. For curves having an initial dilatatory response in which an initial rise in pore pressure occurs before reaching a peak, the relative time from the peak value is used in determining t_{50} . In cases where the time to peak is excessive, t_{50} values are not calculated.

Due to possible inherent uncertainties in estimating l_r , the equilibrium pore pressure and the effect of an initial dilatatory response on calculating t_{50} , other methods should be applied to confirm the results for c_h .

Additional published methods for estimating the coefficient of consolidation from a piezocone test are described in Burns and Mayne (1998, 2002), Jones and Van Zyl (1981), Robertson et al. (1992) and Sully et al. (1999).

A summary of the pore pressure dissipation tests and dissipation plots are presented in the relevant appendix.

Full flow penetration testing (BCPTu) is performed in conjunction with a piezocone penetration test using an integrated electronic piezocone with a spherical attachment and a data acquisition system manufactured by Adara Systems Ltd., a subsidiary of ConeTec.

ConeTec's piezocone penetrometers are compression type designs in which the tip and friction sleeve load cells are independent and have separate load capacities. The piezocones use strain gauged load cells for tip and sleeve friction and a strain gauged diaphragm type transducer for recording pore pressure. The piezocones also have a platinum resistive temperature device (RTD) for monitoring the temperature of the sensors, an accelerometer type dual axis inclinometer and a geophone sensor for recording seismic signals. All signals are amplified downhole within the cone body and the analog signals are sent to the surface through a shielded cable.

ConeTec penetrometers are manufactured with various tip, friction and pore pressure capacities in 5 cm², 10 cm² and 15 cm² tip base area configurations in order to maximize signal resolution for various soil conditions. The 15 cm² penetrometers do not require friction reducers as they have a diameter larger than the deployment rods. The 5 cm² and 10 cm² piezocones use a friction reducer consisting of a rod adapter extension behind the main cone body with an enlarged cross-sectional area (typically forty-four millimeter diameter over a length of thirty-two millimeters with tapered leading and trailing edges) located at a distance of 585 millimeters above the cone tip.

The penetrometers are designed with equal end area friction sleeves, a net end area ratio of 0.8 and cone tips with a sixty-degree apex angle.

The piezocone penetrometers are manufactured with dimensions, tolerances and sensor characteristics that are in general accordance with the current [ASTM D5778](#) standard. ConeTec's calibration criteria also meet or exceed those of the current [ASTM D5778](#) standard.

For ball full flow penetration tests, the cone tip is replaced with a spherical attachment that can have projected plan areas of 40 cm², 60 cm², 100 cm² or 150 cm². The selection of the size is based on soil strength and deployment limitations. An illustration of the piezocone with a spherical attachment is presented in [Figure BCPTu](#).

The specific piezocone and ball area used for each test is described in the ball full flow penetration test summary presented in the relevant appendix.

Figure BCPTu. Piezocone penetrometer with a spherical attachment

The ConeTec data acquisition systems consist of a Windows based computer and a signal conditioner and power supply interface box with a sixteen-bit (or greater) analog to digital (A/D) converter. The data is recorded in fixed depth increments using a depth wheel attached to the push cylinders or by using a spring loaded rubber depth wheel that is held against the cone rods. The typical recording interval is 2.5 centimeters; custom recording intervals are possible.

The system displays the data in real time and records the following parameters to a storage media during penetration:

- Depth
- Uncorrected ball tip resistance (q_b)
- Sleeve friction (f_s)
- Dynamic pore pressure (u) at the shoulder (u_2) or at the equator of the ball
- Additional sensors such as resistivity, passive gamma, ultra violet induced fluorescence, if applicable

Prior to the start of a BCPTu sounding a suitable cone and spherical attachment are selected, the cone and data acquisition system are powered on, the pore pressure system is saturated with silicone oil and the baseline readings are recorded with the ball hanging freely in a vertical position.

The BCPTu is conducted at a steady rate of two centimeters per second, within acceptable tolerances. Typically, one-meter length rods with an outer diameter of 38.1 millimeters are added to advance the ball to the sounding termination depth. The test may be interrupted at selected depths to cycle the probe up and down in order to achieve a completely remolded soil state. Cycling is typically conducted during retraction of the ball and the number of conducted cycles is dependent on reaching a consistent tip value. After ball retraction the final baselines are recorded.

The full flow penetration test can be halted at specific depths to carry out pore pressure dissipation (PPD) tests. For each dissipation test the data acquisition system measures and records the variation of the pore pressure (u) with time (t). Pore pressure dissipation data can be interpreted to provide estimates of equilibrium pore pressures (u_{eq}).

Additional information pertaining to ConeTec's full flow penetration testing procedures:

- Each filter is saturated in silicone oil under vacuum pressure prior to use
- Recorded baselines are checked with an independent multi-meter
- Baseline readings are compared to previous readings verifying compliance with [ASTM](#) standards
- Soundings are terminated at the client's target depth or at a depth where an obstruction is encountered, excessive rod flex occurs or excessive inclination occurs, equipment damage is likely to take place or a dangerous working environment arises
- Differences between initial and final baselines are calculated to ensure zero load offsets have not occurred and to ensure compliance with [ASTM](#) standards

Full flow penetration tests are conducted to assess the undrained shear strength (S_u) of low to medium strength soils. During penetration, the soil flows around the penetrometer significantly reducing the influence of overburden stress as compared to the cone penetration test (CPTu). For the test to be valid, the soil must flow around the penetrometer. Cycling is conducted in order to achieve a completely remolded soil state to provide an indication of sensitivity in soft soils.

The recorded ball tip resistance (q_b) is the total force acting on the piezocone spherical attachment divided by its base area. The ball tip resistance is corrected for pore pressure effects and termed corrected ball tip resistance (q_{bt}) according to the following expression:

$$q_{bt} = q_b + [(1-a)u_2] \frac{A_s}{A_p}$$

where: q_{bt} is the corrected ball tip resistance

q_b is the recorded ball tip resistance

u_2 is the recorded dynamic pore pressure behind the tip (u_2 position)

a is the Net Area Ratio for the piezocone (0.8 for ConeTec probes)

A_s is the shaft area

A_p is the ball plan area

The undrained shear strength (S_u) derived from the full flow penetration test is related to the net ball tip resistance ($q_{bt\text{net}}$) and ball factor (N_{ball}) using the following relationship:

$$S_u = \frac{q_{bt\text{net}}}{N_{\text{ball}}}$$

Due to different geometry and the subdued sleeve and pore pressure response, full flow penetration test results are not used for the interpretation of other geotechnical parameters or for soil classification.

A summary of the BCPTu soundings along with test details and individual plots are provided in the appendices. Tabular results generated for each sounding are provided in Excel format in the data release folder. Information regarding the calculated parameters is also included in the data release folder.

For additional information on full flow penetrometer testing, refer to [Weemees et al. \(2006\)](#).

The electric field vane system is manufactured by Adara Systems Ltd., a subsidiary of ConeTec. An illustration of the uphole vane system configuration is presented in [Figure eVST](#).

Figure eVST. Illustration of the uphole electric field vane system configuration

The vane system is designed with an array of strain gauges in a load cell that measure the applied torque. The torque signal is amplified and converted to digital data within the tool and transmitted to the data acquisition system through a shielded cable. The system uses a friction slip coupler to permit the free slip or play of approximately fifteen degrees between the rods and the vane blade in order to isolate and record rod friction from the soil before rotation of the vane blade starts. The system is designed to use vane blades of various sizes and configurations that connect to the friction slip coupler. The vane blades manufactured by Adara have dimensions and tolerances that are in general accordance with the current [ASTM D2573](#) standards. In very soft soil conditions and at the request of the client, ConeTec may use a large diameter vane blade that exceeds the [ASTM D2573](#) maximum size specifications in order to maximize torque resolution. In very stiff soil conditions and at the request of the client, ConeTec may use a smaller diameter vane blade than the minimum size specified in [ASTM D2573](#) in order to obtain a peak torque below the capacity of the load cell.

The electric motor (capable of 100 Newton-meters of torque) is designed to clamp onto and rotate the rods and vane blade at a constant rate.

ConeTec's calibration criteria of the load cells are in accordance with the current [ASTM D2573](#) standard.

The data acquisition system consists of a computer that records the vane data every 0.2 degrees of rotation. The system records the following parameters and saves them to a file as the test is conducted:

- Torque in Newton-meters
- Rotation in degrees
- Elapsed time in seconds (from the start of the test)

All testing is performed in accordance to ConeTec's field vane testing operating procedures and in general accordance with the current [ASTM D2573](#) standard. For additional information on vane shear testing refer to [Greig et al. \(1987\)](#).

Prior to the start of a vane shear test profile, a suitable sized vane blade is selected, the vane system is powered on and the vane load cell baseline reading is recorded with the load cell hanging freely in a vertical position.

The vane blade, slip coupler and rods are advanced to the desired test depth through a cased hole, typically using AWJ drill rods or one-meter length rods with an outer diameter of 1.5 inches (38.1 millimeters). Test depths are referenced to the middle of the rectangular portion of the vane blade. The motor rotates the rods at a near constant rate up to and beyond the yield stress (peak) until the load remains near constant (post peak). Following post peak readings, the vane blade is then rapidly rotated clockwise ten times to completely remold the soil. The test procedure is repeated in order to record the remolded strength of the soil. The vane blade is then advanced to the next depth and the procedure is repeated or the vane blade is retracted to allow for drilling and vane blade size changes. Once the vane profile is complete, the final baseline of the load cell is recorded and compared to previous reading as a QA/QC check.

Undrained shear strength from the field vane, $(S_u)_{fv}$, is calculated from torque measurements using the following general equation ([ASTM D2573](#)) taking into consideration the case of rectangular or tapered ends at the top and/or bottom of the vane blade.

$$(S_u)_{fv} = \frac{12 \cdot T_{\max}}{\pi D^2 \left(\frac{D}{\cos(i_T)} + \frac{D}{\cos(i_B)} + 6H \right)}$$

where:

$(S_u)_{fv}$ = undrained shear strength from the field vane

T_{max} = maximum value of torque

D = vane diameter

H = height of the rectangular portion of the vane

i_T = angle of taper at vane top (with respect to horizontal)

i_B = angle of taper at vane bottom (with respect to horizontal)

For rectangular vane blades where $H/D = 2$, the above equation simplifies to:

$$(S_u)_{fv} = \frac{6 \cdot T_{max}}{7\pi D^3}$$

The recorded rod friction is subtracted from the peak and remolded torque. No correction factors are applied to the vane results to derive the mobilized shear strength ($\tau_{mobilized}$).

A summary of the vane shear tests, a table of results and individual VST plots are provided in the relevant appendices. Tabular data in Excel format is provided in the data release folder.

Totals	22 soundings				547.89			

1. Phreatic surface measured from barge deck with weighted tip tape at each location. Hydrostatic profile applied to interpretation tables
2. CPT sounding completed from land based machine - all other locations completed from floating barge platform.
3. Coordinates were provided by client
4. Coordinates currently not available. Coordinates will be provided by client at a later date

1. Coordinates were provided by client
2. Coordinates currently not available. Coordinates will be provided by client at a later date
3. Test depth reference depth below mudline.
4. All vane tests were completed from the floating barge platform. The vane test results were affected by barge movement from local waves, local vessel traffic and river flow. Additionally, the vane results were susceptible to elevation change from either rising or falling tide. Over the course of a vane test the barge would gain/lose approximately 1"-4" of elevation due to tidal effects.

Geotechnical Laboratory Testing

July 19, 2022

Anchor QEA, LLC.
1201 3rd Avenue, Suite 2600
Seattle, WA 98101

To Whom It May Concern,

MTC approves and authorizes the release and publication of statements, conclusions, and extracts from or regarding our reports to Anchor QEA, LLC.

If you have any other questions, feel free to call us at (360) 755-1990, or email me at alex.eifrig@mtc-inc.net.

Thank you,

MATERIALS TESTING & CONSULTING, INC.

Alex Eifrig
NW Region Laboratory Manager
WABO Supervising Laboratory Technician

Client: Anchor QEA
Address: 21328 2nd Drive SE
Bothell, WA 98021
Attn: Garrett Timm
Revised on: _____

Date: September 23, 2021
Project: Q.C. - Lower Duwamish Waterway
Project #: 21B233
Sample #: B21-1427 - 1446
Date sampled: 7-7-21 & 7-8-21

As requested MTC, Inc. has performed the following test(s) on the sample referenced above. The testing was performed in accordance with current applicable AASHTO or ASTM standards as indicated below. The results obtained in our laboratory were as follows below or on the attached pages:

	Test(s) Performed:	Test Results		Test(s) Performed:	Test Results
<input checked="" type="checkbox"/>	Sieve Analysis	Please See Attached Reports		Sulfate Soundness	
	Proctor			Bulk Density & Voids	
	Sand Equivalent			WSDOT Degradation	
	Fracture Count			LA Abrasion	
<input checked="" type="checkbox"/>	Moisture Content	Please See Attached Report	<input checked="" type="checkbox"/>	Direct Shear	Please See Attached Reports
	Specific Gravity, Coarse		<input checked="" type="checkbox"/>	Specific Gravity, Soils	Please See Attached Reports
	Specific Gravity, Fine				
<input checked="" type="checkbox"/>	Hydrometer Analysis	Please See Attached Reports			
<input checked="" type="checkbox"/>	Atterberg Limits	Please See Attached Reports			

If you have any questions concerning the test results, the procedures used, or if we can be of any further assistance please call on us at the number below.

Respectfully Submitted,
 Meghan Blodgett-Carrillo
 WABO Supervising Laboratory Technician

Comments: Liquid limit cannot be established as the material displays rapid dilation upon spreading into the cup. At lower moistures the material does not spread into the liquid limit cup without tearing the soil cake. Plastic limit cannot be determined as the material does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

Direct Shear Test Results:

ASTM D-3080

Project: Q.C. - Lower Duwamish Waterway
 Project Number: 21B233
 Laboratory Sample ID: B21-1430
 Sample Date: 7/7/2021
 Test Date: 9/20/2021
 Technician: M. Carrillo

Sample Source: LDW21-GT10-GB-14-19 ft
 Visual Soil Description: brown clayey silt
 Type of Specimen: Remolded Cylindrical Shear Box
 Specimen Diameter (in): 2.5
 Specimen Height (in): 1
 Rate of Strain (in/min): 0.0042
 Estimated Specific Gravity of Solids: 2.65

Summary of Sample Data: $\sigma_n=500$ PSF		
Initial Moisture Content (%)	45.3	
	Initial	Post-Consolidation
Dry Density (PCF):	91.7	95.2
Void Ratio:	0.837	0.770
Porosity (%):	45.6	43.5
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=1000$ PSF		
Initial Moisture Content (%)	40.4	
	Initial	Post-Consolidation
Dry Density (PCF):	95.4	102.4
Void Ratio:	0.765	0.646
Porosity (%):	43.4	39.3
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=2000$ PSF		
Initial Moisture Content (%)	37.0	
	Initial	Post-Consolidation
Dry Density (PCF):	97.7	106.6
Void Ratio:	0.725	0.581
Porosity (%):	42.0	36.7
Degree of Saturation (%):	saturated	saturated

ESTIMATED STRENGTH PARAMETERS		
	PEAK	RESIDUAL
Angle of Internal Friction, ϕ (°):	37	33
Cohesion (PSF):	0	0

Failure Envelope Test Values:			
Normal Stress, σ_n (PSF):	500	1000	2000
Peak Horizontal Stress, τ_h (PSF):	370	840	1430
Residual Horizontal Stress, τ_r (PSF):	290	640	1310

Date: September 28, 2021
Project: Q.C. - Lower Duwamish Waterway
Project #: 21B233
Sample #: B21-1321 - 1335
Date sampled: 7-26-21 & 7-27-21

As requested MTC, Inc. has performed the following test(s) on the sample referenced above. The testing was performed in accordance with current applicable AASHTO or ASTM standards as indicated below. The results obtained in our laboratory were as follows below or on the attached pages:

	Test(s) Performed:	Test Results		Test(s) Performed:	Test Results
X	Sieve Analysis	Please See Attached Reports		Sulfate Soundness	
	Proctor			Bulk Density & Voids	
	Sand Equivalent			WSDOT Degradation	
	Fracture Count			LA Abrasion	
X	Moisture Content	Please See Attached Report	X	Direct Shear	Please See Attached Reports
	Specific Gravity, Coarse		X	Specific Gravity, Soils	Please See Attached Reports
	Specific Gravity, Fine				
X	Hydrometer Analysis	Please See Attached Reports			
X	Atterberg Limits	Please See Attached Reports			

If you have any questions concerning the test results, the procedures used, or if we can be of any further assistance please call on us at the number below.

Respectfully Submitted,
 Meghan Blodgett-Carrillo

As a mutual protection to clients, the public and ourselves, all reports are submitted as the confidential property of clients, and authorization for publication of statements, conclusions or extracts from or regarding our reports is reserved pending our written approval.

Comments: Liquid limit cannot be established as the material displays rapid dilation upon spreading into the cup. At lower moistures the material does not spread into the liquid limit device without tearing the soil cake. Plastic limit cannot be determined as the material does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

ASTM D-3080

Project: Q.C. - Lower Duwamish Waterway
 Project Number: 21B233
 Laboratory Sample ID: B21-1329
 Sample Date: 7/26/2021
 Test Date: 8/26/2021
 Technician: M. Carrillo

Sample Source: LDW-GT36-3.6-6.2 ft
 Visual Soil Description: brown silty sand
 Type of Specimen: Remolded Cylindrical Shear Box
 Specimen Diameter (in): 2.5
 Specimen Height (in): 1
 Rate of Strain (in/min): 0.0208
 Estimated Specific Gravity of Solids: 2.65

Summary of Sample Data: $\sigma_n=500$ PSF		
Initial Moisture Content (%):	19.8	
	Initial	Post-Consolidation
Dry Density (PCF):	114.5	115.4
Void Ratio:	0.472	0.460
Porosity (%):	32.1	31.5
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=1000$ PSF		
Initial Moisture Content (%):	20.2	
	Initial	Post-Consolidation
Dry Density (PCF):	115.0	117.1
Void Ratio:	0.465	0.439
Porosity (%):	31.7	30.5
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=2000$ PSF		
Initial Moisture Content (%):	19.0	
	Initial	Post-Consolidation
Dry Density (PCF):	115.4	120.1
Void Ratio:	0.460	0.403
Porosity (%):	31.5	28.7
Degree of Saturation (%):	saturated	saturated

ESTIMATED STRENGTH PARAMETERS		
	PEAK	RESIDUAL
Angle of Internal Friction, ϕ (°):	36	32
Cohesion (PSF):	0	0

Failure Envelope Test Values:			
Normal Stress, σ_n (PSF):	500	1000	2000
Peak Horizontal Stress, τ_h (PSF):	400	680	1440
Residual Horizontal Stress, τ_r (PSF):	250	570	1300

Comments: Liquid limit cannot be established as the material displays rapid dilation upon spreading into the cup. At lower moistures the material does not spread into the liquid limit device without tearing the soil cake. Plastic limit cannot be determined as the material does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

Date: September 29, 2021
Project: Q.C. - Lower Duwamish Waterway
Project #: 21B233
Sample #: B21-1447 - 1466
Date sampled: 7-8-21 & 7-9-21

As requested MTC, Inc. has performed the following test(s) on the sample referenced above. The testing was performed in accordance with current applicable AASHTO or ASTM standards as indicated below. The results obtained in our laboratory were as follows below or on the attached pages:

	Test(s) Performed:	Test Results		Test(s) Performed:	Test Results
X	Sieve Analysis	Please See Attached Reports		Sulfate Soundness	
	Proctor			Bulk Density & Voids	
	Sand Equivalent			WSDOT Degradation	
	Fracture Count			LA Abrasion	
X	Moisture Content	Please See Attached Report	X	Direct Shear	Please See Attached Reports
	Specific Gravity, Coarse		X	Specific Gravity, Soils	Please See Attached Reports
	Specific Gravity, Fine				
X	Hydrometer Analysis	Please See Attached Reports			
X	Atterberg Limits	Please See Attached Reports			

If you have any questions concerning the test results, the procedures used, or if we can be of any further assistance please call on us at the number below.

Respectfully Submitted,

Comments: Liquid limit cannot be established as the material displays rapid dilation upon spreading into the cup. At lower moistures the material does not spread into the cup without tearing the soil cake. Plastic limit cannot be determined as the material does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

Direct Shear Test Results:

ASTM D-3080

Project: Q.C. - Lower Duwamish Waterway
 Project Number: 21B233
 Laboratory Sample ID: B21-1451
 Sample Date: 7/8/2021
 Test Date: 8/23/2021
 Technician: M. Carrillo

Sample Source: LDW21-GT12-GB-18-22 ft
 Visual Soil Description: brown clayey silt
 Type of Specimen: Remolded Cylindrical Shear Box
 Specimen Diameter (in): 2.5
 Specimen Height (in): 1
 Rate of Strain (in/min): 0.0208
 Estimated Specific Gravity of Solids: 2.65

Summary of Sample Data: $\sigma_n=500$ PSF		
Initial Moisture Content (%)	34.3	
	Initial	Post-Consolidation
Dry Density (PCF):	104.7	112.4
Void Ratio:	0.609	0.499
Porosity (%):	37.9	33.3
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=1000$ PSF		
Initial Moisture Content (%)	32.5	
	Initial	Post-Consolidation
Dry Density (PCF):	106.6	117.5
Void Ratio:	0.580	0.433
Porosity (%):	36.7	30.2
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=2000$ PSF		
Initial Moisture Content (%)	34.7	
	Initial	Post-Consolidation
Dry Density (PCF):	104.7	119.6
Void Ratio:	0.609	0.409
Porosity (%):	37.8	29.0
Degree of Saturation (%):	saturated	saturated

ESTIMATED STRENGTH PARAMETERS		
	PEAK	RESIDUAL
Angle of Internal Friction, ϕ (°):	33	32
Cohesion (PSF):	0	0

Failure Envelope Test Values:			
Normal Stress, σ_n (PSF):	500	1000	2000
Peak Horizontal Stress, τ_h (PSF):	320	680	1300
Residual Horizontal Stress, τ_h (PSF):	260	620	1260

Comments: Liquid limit cannot be established as the material displays rapid dilation upon spreading into the cup. At lower moistures the material does not spread into the cup without tearing the soil cake. Plastic limit cannot be determined as the material does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

Direct Shear Test Results:

ASTM D-3080

Project: Q.C. - Lower Duwamish Waterway
 Project Number: 21B233
 Laboratory Sample ID: B21-1462
 Sample Date: 7/8/2021
 Test Date: 8/31/2021
 Technician: M. Carrillo

Sample Source: LDW21-GT9-GB-20-21.5 ft
 Visual Soil Description: brown silty sand
 Type of Specimen: Remolded Cylindrical Shear Box
 Specimen Diameter (in): 2.5
 Specimen Height (in): 1
 Rate of Strain (in/min): 0.0042
 Estimated Specific Gravity of Solids: 2.65

Summary of Sample Data: $\sigma_n=500$ PSF		
Initial Moisture Content (%):	22.7	
	Initial	Post-Consolidation
Dry Density (PCF):	112.8	114.5
Void Ratio:	0.494	0.471
Porosity (%):	33.0	32.0
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=1000$ PSF		
Initial Moisture Content (%):	21.4	
	Initial	Post-Consolidation
Dry Density (PCF):	113.5	120.4
Void Ratio:	0.485	0.399
Porosity (%):	32.7	28.5
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=2000$ PSF		
Initial Moisture Content (%):	19.9	
	Initial	Post-Consolidation
Dry Density (PCF):	114.3	123.5
Void Ratio:	0.474	0.364
Porosity (%):	32.1	26.7
Degree of Saturation (%):	saturated	saturated

ESTIMATED STRENGTH PARAMETERS		
	PEAK	RESIDUAL
Angle of Internal Friction, ϕ (°):	39	32
Cohesion (PSF):	0	0

Failure Envelope Test Values:			
Normal Stress, σ_n (PSF):	500	1000	2000
Peak Horizontal Stress, τ_h (PSF):	400	860	1590
Residual Horizontal Stress, τ_r (PSF):	260	600	1300

Sample #: B21-1535-1552
Date sampled: July 9, 2021

As requested MTC, Inc. has performed the following test(s) on the sample referenced above. The testing was performed in accordance with current applicable AASHTO or ASTM standards as indicated below. The results obtained in our laboratory were as follows below or on the attached pages:

	Test(s) Performed:	Test Results		Test(s) Performed:	Test Results
X	Sieve Analysis	Please See Attached Reports		Sulfate Soundness	
	Proctor			Bulk Density & Voids	
	Sand Equivalent			WSDOT Degradation	
	Fracture Count			LA Abrasion	
X	Moisture Content	Please See Attached Report	X	Direct Shear	Please See Attached Reports
	Specific Gravity, Coarse		X	Specific Gravity, Soils	Please See Attached Reports
	Specific Gravity, Fine				
X	Hydrometer Analysis	Please See Attached Reports			
X	Atterberg Limits	Please See Attached Reports			

If you have any questions concerning the test results, the procedures used, or if we can be of any further assistance please call on us at the number below.

Respectfully Submitted,
 Meghan Blodgett-Carrillo

ASTM D-3080

Project: Q.C. - Lower Duwamish Waterway
 Project Number: 21B233
 Laboratory Sample ID: B21-1546
 Sample Date: 7/9/2021
 Test Date: 9/27/2021
 Technician: M. Carrillo

Sample Source: LDW21-GT2-GB-16-19 ft
 Visual Soil Description: brown sandy silt
 Type of Specimen: Remolded Cylindrical Shear Box
 Specimen Diameter (in): 2.5
 Specimen Height (in): 1
 Rate of Strain (in/min): 0.0042
 Estimated Specific Gravity of Solids: 2.65

Summary of Sample Data: $\sigma_n=500$ PSF		
Initial Moisture Content (%)	38.6	
	Initial	Post-Consolidation
Dry Density (PCF):	100.0	106.5
Void Ratio:	0.684	0.581
Porosity (%):	40.6	36.8
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=1000$ PSF		
Initial Moisture Content (%)	36.2	
	Initial	Post-Consolidation
Dry Density (PCF):	101.4	111.3
Void Ratio:	0.661	0.514
Porosity (%):	39.8	34.0
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=2000$ PSF		
Initial Moisture Content (%)	34.6	
	Initial	Post-Consolidation
Dry Density (PCF):	102.5	110.5
Void Ratio:	0.643	0.525
Porosity (%):	39.1	34.4
Degree of Saturation (%):	saturated	saturated

ESTIMATED STRENGTH PARAMETERS		
	PEAK	RESIDUAL
Angle of Internal Friction, ϕ (°):	36	33
Cohesion (PSF):	0	0

Failure Envelope Test Values:			
Normal Stress, σ_n (PSF):	500	1000	2000
Peak Horizontal Stress, τ_h (PSF):	330	680	1490
Residual Horizontal Stress, τ_r (PSF):	280	590	1320

Comments: Liquid limit cannot be established as the material displays rapid dilation upon spreading into the cup. At lower moistures the material does not spread into the liquid limit device without tearing the soil cake. Plastic limit cannot be determined as the material does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

Direct Shear Test Results:

ASTM D-3080

Project: Q.C. - Lower Duwamish Waterway
 Project Number: 21B233
 Laboratory Sample ID: B21-1551
 Sample Date: 7/9/2021
 Test Date: 9/23/2021
 Technician: M. Carrillo

Sample Source: LDW21-GT1-GB-10-20 ft
 Visual Soil Description: brown silty sand
 Type of Specimen: Remolded Cylindrical Shear Box
 Specimen Diameter (in): 2.5
 Specimen Height (in): 1
 Rate of Strain (in/min): 0.0208
 Estimated Specific Gravity of Solids: 2.65

Summary of Sample Data: $\sigma_n=500$ PSF		
Initial Moisture Content (%)	30.0	
	Initial	Post-Consolidation
Dry Density (PCF):	106.5	108.9
Void Ratio:	0.581	0.547
Porosity (%):	36.8	35.4
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=1000$ PSF		
Initial Moisture Content (%)	29.7	
	Initial	Post-Consolidation
Dry Density (PCF):	598.3	612.5
Void Ratio:	-0.718	-0.725
Porosity (%):	-255.1	-263.6
Degree of Saturation (%):	-111.5	saturated

Summary of Sample Data: $\sigma_n=2000$ PSF		
Initial Moisture Content (%)	29.8	
	Initial	Post-Consolidation
Dry Density (PCF):	107.6	113.2
Void Ratio:	0.566	0.488
Porosity (%):	36.1	32.8
Degree of Saturation (%):	saturated	saturated

ESTIMATED STRENGTH PARAMETERS		
	PEAK	RESIDUAL
Angle of Internal Friction, ϕ (°):	38	32
Cohesion (PSF):	0	0

Failure Envelope Test Values:			
Normal Stress, σ_n (PSF):	500	1000	2000
Peak Horizontal Stress, τ_h (PSF):	310	760	1560
Residual Horizontal Stress, τ_r (PSF):	260	600	1250

Date: October 1, 2021
Project: Q.C. - Lower Duwamish Waterway
Project #: 21B233
Sample #: B21-1563-1577
Date sampled: 7-12-21 & 7-13-21

As requested MTC, Inc. has performed the following test(s) on the sample referenced above. The testing was performed in accordance with current applicable AASHTO or ASTM standards as indicated below. The results obtained in our laboratory were as follows below or on the attached pages:

	Test(s) Performed:	Test Results		Test(s) Performed:	Test Results
<input checked="" type="checkbox"/>	Sieve Analysis	Please See Attached Reports		Sulfate Soundness	
	Proctor			Bulk Density & Voids	
	Sand Equivalent			WSDOT Degradation	
	Fracture Count			LA Abrasion	
<input checked="" type="checkbox"/>	Moisture Content	Please See Attached Report	<input checked="" type="checkbox"/>	Direct Shear	Please See Attached Reports
	Specific Gravity, Coarse		<input checked="" type="checkbox"/>	Specific Gravity, Soils	Please See Attached Reports
	Specific Gravity, Fine				
<input checked="" type="checkbox"/>	Hydrometer Analysis	Please See Attached Reports			
<input checked="" type="checkbox"/>	Atterberg Limits	Please See Attached Reports			

If you have any questions concerning the test results, the procedures used, or if we can be of any further assistance please call on us at the number below.

Respectfully Submitted,
 Meghan Blodgett-Carrillo

Direct Shear Test Results:

ASTM D-3080

Project: Q.C. - Lower Duwamish Waterway
 Project Number: 21B233
 Laboratory Sample ID: B21-1564
 Sample Date: 7/12/2021
 Test Date: 9/20/2021
 Technician: M. Carrillo

Sample Source: LDW21-GT13-GB-0-11 ft
 Visual Soil Description: brown sand with silt
 Type of Specimen: Remolded Cylindrical Shear Box
 Specimen Diameter (in): 2.5
 Specimen Height (in): 1
 Rate of Strain (in/min): 0.0208
 Estimated Specific Gravity of Solids: 2.65

Summary of Sample Data: $\sigma_n=500$ PSF		
Initial Moisture Content (%):	32.6	
	Initial	Post-Consolidation
Dry Density (PCF):	104.7	106.1
Void Ratio:	0.608	0.589
Porosity (%):	37.8	37.0
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=1000$ PSF		
Initial Moisture Content (%):	30.5	
	Initial	Post-Consolidation
Dry Density (PCF):	105.5	108.0
Void Ratio:	0.597	0.560
Porosity (%):	37.4	35.9
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=2000$ PSF		
Initial Moisture Content (%):	31.4	
	Initial	Post-Consolidation
Dry Density (PCF):	105.7	113.8
Void Ratio:	0.595	0.481
Porosity (%):	37.3	32.5
Degree of Saturation (%):	saturated	saturated

ESTIMATED STRENGTH PARAMETERS		
	PEAK	RESIDUAL
Angle of Internal Friction, ϕ (°):	35	32
Cohesion (PSF):	0	0

Failure Envelope Test Values:			
Normal Stress, σ_n (PSF):	500	1000	2000
Peak Horizontal Stress, τ_h (PSF):	330	790	1360
Residual Horizontal Stress, τ_r (PSF):	290	700	1230

Comments: Liquid limit cannot be established as the material displays rapid dilation upon spreading into the cup. At lower moistures the material does not spread into the liquid limit cup without tearing the soil cake. Plastic limit cannot be determined as the material does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

Project: Q.C. - Lower Duwamish Waterway
 Project Number: 21B233
 Laboratory Sample ID: B21-1574
 Sample Date: 7/13/2021
 Test Date: 9/21/2021
 Technician: M. Carrillo

Sample Source: LDW21-GT19-GB-8.5-18.5 ft
 Visual Soil Description: brown sand with silt
 Type of Specimen: Remolded Cylindrical Shear Box
 Specimen Diameter (in): 2.5
 Specimen Height (in): 1
 Rate of Strain (in/min): 0.0208
 Estimated Specific Gravity of Solids: 2.65

Summary of Sample Data: $\sigma_n=500$ PSF		
Initial Moisture Content (%):	27.5	
	Initial	Post-Consolidation
Dry Density (PCF):	106.2	107.3
Void Ratio:	0.586	0.570
Porosity (%):	37.0	36.3
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=1000$ PSF		
Initial Moisture Content (%):	26.1	
	Initial	Post-Consolidation
Dry Density (PCF):	108.0	109.7
Void Ratio:	0.560	0.536
Porosity (%):	35.9	34.9
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=2000$ PSF		
Initial Moisture Content (%):	24.7	
	Initial	Post-Consolidation
Dry Density (PCF):	109.2	111.5
Void Ratio:	0.543	0.511
Porosity (%):	35.2	33.8
Degree of Saturation (%):	saturated	saturated

ESTIMATED STRENGTH PARAMETERS		
	PEAK	RESIDUAL
Angle of Internal Friction, ϕ (°):	38	34
Cohesion (PSF):	0	0

Failure Envelope Test Values:			
Normal Stress, σ_n (PSF):	500	1000	2000
Peak Horizontal Stress, τ_h (PSF):	400	800	1580
Residual Horizontal Stress, τ_h (PSF):	370	700	1340

As requested MTC, Inc. has performed the following test(s) on the sample referenced above. The testing was performed in accordance with current applicable AASHTO or ASTM standards as indicated below. The results obtained in our laboratory were as follows below or on the attached pages:

	Test(s) Performed:	Test Results		Test(s) Performed:	Test Results
<input checked="" type="checkbox"/>	Sieve Analysis	Please See Attached Reports		Sulfate Soundness	
	Proctor			Bulk Density & Voids	
	Sand Equivalent			WSDOT Degradation	
	Fracture Count			LA Abrasion	
<input checked="" type="checkbox"/>	Moisture Content	Please See Attached Report	<input checked="" type="checkbox"/>	Direct Shear	Please See Attached Reports
	Specific Gravity, Coarse		<input checked="" type="checkbox"/>	Specific Gravity, Soils	Please See Attached Reports
	Specific Gravity, Fine				
<input checked="" type="checkbox"/>	Hydrometer Analysis	Please See Attached Reports			
<input checked="" type="checkbox"/>	Atterberg Limits	Please See Attached Reports			

If you have any questions concerning the test results, the procedures used, or if we can be of any further assistance please call on us at the number below.

Comments: Liquid limit cannot be established as the material displays rapid dilation upon spreading into the cup. At lower moistures the material does not spread into the liquid limit cup without tearing the soil cake. Plastic limit cannot be determined as the material does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

As requested MTC, Inc. has performed the following test(s) on the sample referenced above. The testing was performed in accordance with current applicable AASHTO or ASTM standards as indicated below. The results obtained in our laboratory were as follows below or on the attached pages:

	Test(s) Performed:	Test Results		Test(s) Performed:	Test Results
X	Sieve Analysis	Please See Attached Reports		Sulfate Soundness	
	Proctor			Bulk Density & Voids	
	Sand Equivalent			WSDOT Degradation	
	Fracture Count			LA Abrasion	
X	Moisture Content	Please See Attached Report	X	Direct Shear	Please See Attached Reports
	Specific Gravity, Coarse		X	Specific Gravity, Soils	Please See Attached Reports
	Specific Gravity, Fine				
X	Hydrometer Analysis	Please See Attached Reports			
X	Atterberg Limits	Please See Attached Reports			

If you have any questions concerning the test results, the procedures used, or if we can be of any further assistance please call on us at the number below.

Respectfully Submitted,

Comments: Liquid limit cannot be established as the material displays rapid dilation upon spreading into the cup. At lower moistures the material does not spread into the liquid limit cup without tearing the soil cake. Plastic limit cannot be determined as the material does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

Direct Shear Test Results:

ASTM D-3080

Project: Q.C. - Lower Duwamish Waterway
 Project Number: 21B233
 Laboratory Sample ID: B21-1800
 Sample Date: 7/14/2021
 Test Date: 9/29/2021
 Technician: M. Carrillo

Sample Source: LDW21-GT29-GB-21-26 ft
 Visual Soil Description: gray sand
 Type of Specimen: Remolded Cylindrical Shear Box
 Specimen Diameter (in): 2.5
 Specimen Height (in): 1
 Rate of Strain (in/min): 0.0208
 Estimated Specific Gravity of Solids: 2.65

Summary of Sample Data: $\sigma_n=500$ PSF		
Initial Moisture Content (%)	23.0	
	Initial	Post-Consolidation
Dry Density (PCF):	107.5	108.1
Void Ratio:	0.567	0.558
Porosity (%):	36.2	35.8
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=1000$ PSF		
Initial Moisture Content (%)	22.3	
	Initial	Post-Consolidation
Dry Density (PCF):	107.1	108.5
Void Ratio:	0.572	0.552
Porosity (%):	36.4	35.6
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=2000$ PSF		
Initial Moisture Content (%)	21.8	
	Initial	Post-Consolidation
Dry Density (PCF):	108.8	110.9
Void Ratio:	0.548	0.519
Porosity (%):	35.4	34.2
Degree of Saturation (%):	saturated	saturated

ESTIMATED STRENGTH PARAMETERS		
	PEAK	RESIDUAL
Angle of Internal Friction, ϕ (°):	36	34
Cohesion (PSF):	0	0

Failure Envelope Test Values:			
Normal Stress, σ_n (PSF):	500	1000	2000
Peak Horizontal Stress, τ_h (PSF):	270	700	1490
Residual Horizontal Stress, τ_r (PSF):	200	640	1390

Date sampled: July 15, 2021

As requested MTC, Inc. has performed the following test(s) on the sample referenced above. The testing was performed in accordance with current applicable AASHTO or ASTM standards as indicated below. The results obtained in our laboratory were as follows below or on the attached pages:

	Test(s) Performed:	Test Results		Test(s) Performed:	Test Results
X	Sieve Analysis	Please See Attached Reports		Sulfate Soundness	
	Proctor			Bulk Density & Voids	
	Sand Equivalent			WSDOT Degradation	
	Fracture Count			LA Abrasion	
X	Moisture Content	Please See Attached Report	X	Direct Shear	Please See Attached Reports
	Specific Gravity, Coarse		X	Specific Gravity, Soils	Please See Attached Reports
	Specific Gravity, Fine				
X	Hydrometer Analysis	Please See Attached Reports			
X	Atterberg Limits	Please See Attached Reports			

If you have any questions concerning the test results, the procedures used, or if we can be of any further assistance please call on us at the number below.

Respectfully Submitted,
 Meghan Blodgett-Carrillo
 WABO Supervising Laboratory Technician

Comments: Liquid limit cannot be established as the material displays rapid dilation. At lower moistures the material does not spread into the liquid limit device without tearing the soil cake. Plastic limit cannot be determined as the sample does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

 All results apply only to actual locations and materials tested. As a mutual protection to clients, the public and ourselves, all reports are submitted as the confidential property of clients, and authorization for publication of statements, conclusions or extracts from or regarding our reports is reserved pending our written approval.

Comments: Liquid limit cannot be established as the material displays rapid dilation. At lower moistures the material does not spread into the liquid limit device without tearing the soil cake. Plastic limit cannot be determined as the sample does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

Comments: Liquid limit cannot be established as the material displays rapid dilation. At lower moistures the material does not spread into the liquid limit device without tearing the soil cake. Plastic limit cannot be determined as the sample does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

 All results apply only to actual locations and materials tested. As a mutual protection to clients, the public and ourselves, all reports are submitted as the confidential property of clients, and authorization for publication of statements, conclusions or extracts from or regarding our reports is reserved pending our written approval.

Comments: Liquid limit cannot be established as the material displays rapid dilation. At lower moistures the material does not spread into the liquid limit device without tearing the soil cake. Plastic limit cannot be determined as the sample does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

Date sampled: July 16, 2021

As requested MTC, Inc. has performed the following test(s) on the sample referenced above. The testing was performed in accordance with current applicable AASHTO or ASTM standards as indicated below. The results obtained in our laboratory were as follows below or on the attached pages:

	Test(s) Performed:	Test Results		Test(s) Performed:	Test Results
X	Sieve Analysis	Please See Attached Reports		Sulfate Soundness	
	Proctor			Bulk Density & Voids	
	Sand Equivalent			WSDOT Degradation	
	Fracture Count			LA Abrasion	
X	Moisture Content	Please See Attached Report	X	Direct Shear	Please See Attached Reports
	Specific Gravity, Coarse		X	Specific Gravity, Soils	Please See Attached Reports
	Specific Gravity, Fine				
X	Hydrometer Analysis	Please See Attached Reports			
X	Atterberg Limits	Please See Attached Reports			

If you have any questions concerning the test results, the procedures used, or if we can be of any further assistance please call on us at the number below.

Respectfully Submitted,

Comments: Liquid limit cannot be determined as the material displays rapid dilation. At lower moistures the sample does not spread into the cup without tearing the soil cake. Unable to establish plastic limit as the material does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

Revised on: _____

Date: October 19, 2021
Project: Q.C. - Lower Duwamish Waterway
Project #: 21B233
Sample #: B21-2050-2069
Date sampled: 8-4-21 & 8-5-21

As requested MTC, Inc. has performed the following test(s) on the sample referenced above. The testing was performed in accordance with current applicable AASHTO or ASTM standards as indicated below. The results obtained in our laboratory were as follows below or on the attached pages:

	Test(s) Performed:	Test Results		Test(s) Performed:	Test Results
X	Sieve Analysis	Please See Attached Reports		Sulfate Soundness	
	Proctor			Bulk Density & Voids	
	Sand Equivalent			WSDOT Degradation	
	Fracture Count			LA Abrasion	
X	Moisture Content	Please See Attached Report	X	Direct Shear	Please See Attached Reports
	Specific Gravity, Coarse		X	Specific Gravity, Soils	Please See Attached Reports
	Specific Gravity, Fine				
X	Hydrometer Analysis	Please See Attached Reports			
X	Atterberg Limits	Please See Attached Reports			

If you have any questions concerning the test results, the procedures used, or if we can be of any further assistance please call on us at the number below.

Respectfully Submitted,
 Meghan Blodgett-Carrillo
 WABO Supervising Laboratory Technician

Direct Shear Test Results:

ASTM D-3080

Project: Q.C. - Lower Duwamish Waterway
 Project Number: 21B233
 Laboratory Sample ID: B21-2065
 Sample Date: 8/5/2021
 Test Date: 10/15/2021
 Technician: M. Carrillo

Sample Source: LDW21-GT48-GB-5-10 ft
 Visual Soil Description: brown silty sand with gravel
 Type of Specimen: Remolded Cylindrical Shear Box
 Specimen Diameter (in): 2.5
 Specimen Height (in): 1
 Rate of Strain (in/min): 0.0208
 Estimated Specific Gravity of Solids: 2.65

Summary of Sample Data: $\sigma_n=500$ PSF		
	Initial Moisture Content (%)	
	Initial	Post-Consolidation
Dry Density (PCF):	-4530.4	-4603.6
Void Ratio:	-1.037	-1.037
Porosity (%):	2789.0	2832.4
Degree of Saturation (%):	-97.6	saturated

Summary of Sample Data: $\sigma_n=1000$ PSF		
	Initial Moisture Content (%)	
	Initial	Post-Consolidation
Dry Density (PCF):	100.8	104.7
Void Ratio:	0.672	0.610
Porosity (%):	40.2	37.9
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=2000$ PSF		
	Initial Moisture Content (%)	
	Initial	Post-Consolidation
Dry Density (PCF):	100.6	106.4
Void Ratio:	0.675	0.584
Porosity (%):	40.3	36.9
Degree of Saturation (%):	saturated	saturated

ESTIMATED STRENGTH PARAMETERS		
	PEAK	RESIDUAL
Angle of Internal Friction, ϕ (°):	37	32
Cohesion (PSF):	0	0

Failure Envelope Test Values:			
Normal Stress, σ_n (PSF):	500	1000	2000
Peak Horizontal Stress, τ_h (PSF):	380	810	1510
Residual Horizontal Stress, τ_r (PSF):	230	700	1210

HWA Project No. 2012-002-23 Task 51

Materials Testing & Consulting, Inc.

777 Chrysler Drive
Burlington, WA 98233

Attention: Ms. Meghan Blodgett-Carrillo

Subject: **LABORATORY TESTING REPORT**
QC - Lower Duwamish Waterway
MTC Project Number: 21B233

Dear Ms. Blodgett-Carrillo;

In accordance with your request, HWA GeoSciences Inc. (HWA) performed laboratory testing for the above referenced project. Herein we present the results of our laboratory analyses, which are summarized on the attached Figures. The laboratory testing program was performed in general accordance with your instructions and appropriate ASTM Standards as outlined below.

SAMPLE DESCRIPTION: The subject samples were delivered to our laboratory on August 26, 2021 by MTC personnel. The samples were delivered in four Shelby tubes and were designated with exploration ID and depth of sampling. The soil samples were classified using visual-manual methods. The descriptions may be found on the attached Summary of Material Properties, Figure 1.

MOISTURE CONTENT OF SOIL: The moisture contents of the soil samples (percent by dry mass) were determined in general accordance with ASTM D2216. The results are shown on Figure 1.

SPECIFIC GRAVITY OF SOILS: The specific gravity of the selected samples was determined using method ASTM D854. The test results are shown on the attached Summary of Material Properties, Figure 1.

LIQUID LIMIT, PLASTIC LIMIT, AND PLASTICITY INDEX OF SOILS (ATTERBERG LIMITS): The plasticity index of each specified sample was tested using method ASTM D4318, multi-point method. The results are reported on the attached Liquid Limit, Plastic Limit, and Plasticity Index of Soils Report, Figure 2.

CONSOLIDATED UNDRAINED TRIAXIAL COMPRESSION OF SOILS: Selected samples were tested in general accordance with method ASTM D4767 to determine the shear strength characteristics of the soil. The samples were extruded from Shelby tubes, and the test specimens were trimmed to obtain a cylindrical test sample with a length to diameter ratio between 2:1 and 2.5:1. The specimens were carefully weighed and measured prior to testing.

Three trials were run at varying confining stresses specified by the client. Each sample was run using a single specimen to perform a multi-stage shear test.

The multi-stage method was performed by first consolidating the sample at the lowest specified confining pressure. The sample was then sheared until the change in pore pressure was at or near its estimated peak. After reaching the peak change in pore pressure, the shear phase was terminated, and the specimen was reconsolidated at the middle consolidation pressure. Under the second consolidation pressure the sample was again sheared until the change in pore pressure was at or near its estimated peak, at which point the shear was terminated. The sample was reconsolidated a third and final time under the highest confining pressure and shearing was performed to sample failure, concluding the test.

For sample LDW21-GT33-GB at 6.0-8.0', the test was terminated at 20.5% strain due to a spike in pore pressure caused by a perforation in the membrane encasing the sample. As a result, the final moisture content of the sample was affected due to the ingress of water from the surrounding water filled pressure cell. The final moisture content for this sample was determined to be 70.7%.

The Consolidated Undrained test results are summarized and plotted graphically in Figures 3-6.

ONE DIMENSIONAL CONSOLIDATION PROPERTIES OF SOIL: The consolidation properties of selected soil samples were measured in general accordance with ASTM D 2435. Saturation was maintained by inundation of the sample throughout the test. The samples were subjected to increasing increments of total stress, the duration of which was selected to exceed the time required for completion of primary consolidation as defined in the Standard, Method B. Unloading of the sample was carried out incrementally. The primary compression test results are presented on the attached Consolidation Test Reports, Figures 7-10.

CLOSURE: Experience has shown that test values on soil and other natural materials vary with each representative sample. As such, HWA has no knowledge as to the extent and quantity of material the tested samples may represent. HWA also makes no warranty as to how representative either the samples tested or the test results obtained are to actual field conditions. It is a well-established fact that sampling methods present varying degrees of disturbance that affect sample representativeness.

No copy should be made of this report except in its entirety.

We appreciate the opportunity to provide laboratory testing services on this project. Should you have any questions or comments, or if we may be of further service, please call.

Sincerely,

HWA GEOSCIENCES INC.

 All results apply only to actual locations and materials tested. As a mutual protection to clients, the public and ourselves, all reports are submitted as the confidential property of clients, and authorization for publication of statements, conclusions or extracts from or regarding our reports is reserved pending our written approval.

Comments: Liquid limit cannot be established as the material displays rapid dilation upon spreading into the cup. At lower moistures the material does not spread into the liquid limit device without tearing the soil cake. Plastic limit cannot be determined as the material does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

Comments: Liquid limit cannot be established as the material displays rapid dilation upon spreading into the cup. At lower moistures the material does not spread into the liquid limit device without tearing the soil cake. Plastic limit cannot be determined as the material does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

As requested MTC, Inc. has performed the following test(s) on the sample referenced above. The testing was performed in accordance with current applicable AASHTO or ASTM standards as indicated below. The results obtained in our laboratory were as follows below or on the attached pages:

	Test(s) Performed:	Test Results		Test(s) Performed:	Test Results
X	Sieve Analysis	Please See Attached Reports		Sulfate Soundness	
	Proctor			Bulk Density & Voids	
	Sand Equivalent			WSDOT Degradation	
	Fracture Count			LA Abrasion	
X	Moisture Content	Please See Attached Report	X	Direct Shear	Please See Attached Reports
	Specific Gravity, Coarse		X	Specific Gravity, Soils	Please See Attached Reports
	Specific Gravity, Fine				
X	Hydrometer Analysis	Please See Attached Reports			
X	Atterberg Limits	Please See Attached Reports			

If you have any questions concerning the test results, the procedures used, or if we can be of any further assistance please call on us at the number below.

Comments: Liquid limit cannot be established as the material displays rapid dilation. At lower moistures, the material does not spread into the liquid limit device without tearing the soil cake. Plastic limit cannot be determined as the sample does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

Direct Shear Test Results:

ASTM D-3080

Project: Q.C. - Lower Duwamish Waterway
 Project Number: 21B233
 Laboratory Sample ID: B21-2150
 Sample Date: 8/5/2021
 Test Date: 10/18/2021
 Technician: M. Carrillo

Sample Source: LDW21-GT53-GB-5-10 ft
 Visual Soil Description: brown silty sand with gravel
 Type of Specimen: Remolded Cylindrical Shear Box
 Specimen Diameter (in): 2.5
 Specimen Height (in): 1
 Rate of Strain (in/min): 0.0208
 Estimated Specific Gravity of Solids: 2.65

Summary of Sample Data: $\sigma_n=500$ PSF		
Initial Moisture Content (%):	30.0	
	Initial	Post-Consolidation
Dry Density (PCF):	109.7	110.6
Void Ratio:	0.536	0.523
Porosity (%):	34.9	34.3
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=1000$ PSF		
Initial Moisture Content (%):	29.9	
	Initial	Post-Consolidation
Dry Density (PCF):	110.2	112.7
Void Ratio:	0.529	0.495
Porosity (%):	34.6	33.1
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=2000$ PSF		
Initial Moisture Content (%):	29.3	
	Initial	Post-Consolidation
Dry Density (PCF):	110.5	114.2
Void Ratio:	0.524	0.475
Porosity (%):	34.4	32.2
Degree of Saturation (%):	saturated	saturated

ESTIMATED STRENGTH PARAMETERS		
	PEAK	RESIDUAL
Angle of Internal Friction, ϕ (°):	35	34
Cohesion (PSF):	0	0

Failure Envelope Test Values:			
Normal Stress, σ_n (PSF):	500	1000	2000
Peak Horizontal Stress, τ_h (PSF):	340	810	1370
Residual Horizontal Stress, τ_r (PSF):	270	730	1320

Bothell, WA 98021
Attn: Garrett Timm
Revised on: _____

Date: October 25, 2021
Project: Q.C. - Lower Duwamish Waterway
Project #: 21B233
Sample #: B21-2164-2174
Date sampled: 8-3-21 & 8-5-21

As requested MTC, Inc. has performed the following test(s) on the sample referenced above. The testing was performed in accordance with current applicable AASHTO or ASTM standards as indicated below. The results obtained in our laboratory were as follows below or on the attached pages:

	Test(s) Performed:	Test Results		Test(s) Performed:	Test Results
X	Sieve Analysis	Please See Attached Reports		Sulfate Soundness	
	Proctor			Bulk Density & Voids	
	Sand Equivalent			WSDOT Degradation	
	Fracture Count			LA Abrasion	
X	Moisture Content	Please See Attached Report	X	Direct Shear	Please See Attached Reports
	Specific Gravity, Coarse		X	Specific Gravity, Soils	Please See Attached Reports
	Specific Gravity, Fine				
X	Hydrometer Analysis	Please See Attached Reports			
X	Atterberg Limits	Please See Attached Reports			

If you have any questions concerning the test results, the procedures used, or if we can be of any further assistance please call on us at the number below.

Respectfully Submitted,
 Meghan Blodgett-Carrillo
 WABO Supervising Laboratory Technician

Direct Shear Test Results:

ASTM D-3080

Project: Q.C. - Lower Duwamish Waterway
 Project Number: 21B233
 Laboratory Sample ID: B21-2170
 Sample Date: 8/3/2021
 Test Date: 10/18/2021
 Technician: M. Carrillo

Sample Source: LDW21-GT41-GH-0-1.3 ft
 Visual Soil Description: brown sand with silt and gravel
 Type of Specimen: Remolded Cylindrical Shear Box
 Specimen Diameter (in): 2.5
 Specimen Height (in): 1
 Rate of Strain (in/min): 0.0208
 Estimated Specific Gravity of Solids: 2.65

Summary of Sample Data: $\sigma_n=500$ PSF		
Initial Moisture Content (%)	28.1	
	Initial	Post-Consolidation
Dry Density (PCF):	109.2	111.5
Void Ratio:	0.543	0.510
Porosity (%):	35.2	33.8
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=1000$ PSF		
Initial Moisture Content (%)	27.3	
	Initial	Post-Consolidation
Dry Density (PCF):	110.2	115.1
Void Ratio:	0.529	0.464
Porosity (%):	34.6	31.7
Degree of Saturation (%):	saturated	saturated

Summary of Sample Data: $\sigma_n=2000$ PSF		
Initial Moisture Content (%)	28.4	
	Initial	Post-Consolidation
Dry Density (PCF):	109.1	119.9
Void Ratio:	0.545	0.405
Porosity (%):	35.3	28.8
Degree of Saturation (%):	saturated	saturated

ESTIMATED STRENGTH PARAMETERS		
	PEAK	RESIDUAL
Angle of Internal Friction, ϕ (°):	37	33
Cohesion (PSF):	0	0

Failure Envelope Test Values:			
Normal Stress, σ_n (PSF):	500	1000	2000
Peak Horizontal Stress, τ_h (PSF):	370	800	1520
Residual Horizontal Stress, τ_r (PSF):	280	570	1330

Comments: Liquid limit cannot be established as the material displays rapid dilation. At lower moistures the material does not spread into the cup without tearing the soil cake. Plastic limit cannot be determined as the sample does not roll down to 1/8" threads before cracking or crumbling. Non-plastic.

Table C-1
Historical Geotechnical Investigations and Geologic Information

File Title	Identification No. ¹	River Mile	Document Title	Document type	Date Document Creation	Project Location	Sample Types/Report Info	Author
RM 2.9_Boeing_east bank	1	2.9	n/a	partial report/figures	9.11.1990	1135 S. Webster Street (Boeing Company), east bank	CPT logs, MW logs, grain size analysis, boring logs	Geoengineers
Boeing Plant 2_east bank	2, 8, 9, 10	3.1-3.5	Appendix C: Geotechnical Engineering Report, Habitat Project	report	10.2012	Boeing Plant 2 (Seattle/Tukwila)	Subsurface conditions, seismic conditions, liquefaction and lateral spreading analysis, slope stability analysis, shoreline excavation and dredging	AMEC, Floyd Snider, Dalton Olmsted & Fuglevand
RM 3.1-3.3 Boeing Technology Complex_east bank	3	3.1-3.3	Report of Geotechnical Investigation, Proposed Boeing Materials Technology Complex	report	8.13.1992	Boeing North Duwamish Campus, East Bank	Site conditions, subsurface/groundwater conditions, CPT logs, grain size, excavations, pile foundations, seismic aspects	Dames & Moore
RM 3.02_S Monroe St_west bank	4	3.12	Site plan	figures	8.22.1986	South Monroe Street, southwest side Duwamish	Site plan, 2 boring logs with blow counts, observation well install	Geoengineers
RM 3.3-3.6_Boeing Plant 2_east bank	5	3.3-3.6	Boeing Plant 2 RFI	figures (site thickness map, boring logs)	07.3.1997	Boeing Plant 2 (E Marginal Way S and 16th Ave S)	Boring logs, silt thickness and till units	Weston
RM 3_South Park Neighborhood_west bank	6	3.3	South Park Neighborhood Development Program Subsurface Investigations	report	8.1973	South Park Neighborhood	11 test boings (HSA), SPTs, 2 observation well installs, cross sections	Shannon & Wilson
RM 3.33-South Park Bridge	7	3.3	South Park Bridge Replacement Volume 3: Geotechnical Report	compiled reports	8.2007	South Park Bridge	Full geotechnical study (boring logs, seismic, liquefaction, soil motion, soil surface response spectra, shear wave velocity, rock input, etc.)	PB Americas, Shannon & Wilson
Terminal 117 Site Restoration GT Report - Rev 1	11	3.55	Terminal 117 Site Restoration	report	05.07.2014	Terminal 117: Duwamish waterway to the east, Dallas Avenue to the south. South Park marina to the north, parking lot to the west. (Flat around 15 ft)	Subsurface/surface conditions, GW, SPTs, earthquake engineering, liquefaction, design soil parameters, slope stability, ground improvement, shallow foundations, pile design, retaining walls, site development and earthwork	Geoengineers
RM 4.4_Transmission Towers	12	3.5-3.6	Geotechnical and Environmental Engineering Design Study Proposed Duwamish Transmission Towers	report	9.19.2003	Boeing Plant 2. Each bank of the Duwamish River south of the 14th Street bridge (south park bridge)	2 borings, existing geotechnical data, soil/GW subsurface, engineering analysis: seismic, foundations, deep foundations, SPTs	Hart Crowser
RM 3.6 Basin Oil_west bank	13	3.6	Geotechnical Engineering Study for Basin Oil	partial report/logs	02.07.1994	Basin Oil: 8661 Dallas Avenue South, Seattle	Site map and log	Lorilla Engineering
RM 3.6 _Dallas Ave S_west bank	14	3.6	Geotechnical Memorandum	memo	06.10.2014	Dallas Avenue South	10 test pits, 10 pilot infiltration tests, includes figures and logs, grain size	Seattle Public Utilities Geotechnical Engineering
RM 3.6_Jorgensen Forge MWs_east bank	15	3.6	Jorgensen Forge Boring Logs	figure/logs	12.05.1994	8531 E. Marginal Way, Seattle	2 HSA borings to 30 ft	SECOR
Final Inv Data Summ Rpt_021306	16	3.65	Final Investigation Data Summary Report Jorgensen Forge Facility	report	2.13.2006	Jorgenson: 8531 East Marginal Way South	Surface/subsurface samples analyzed for grain size (no deviations)	Farallon Consulting and Anchor Environmental

File Title	Identification No. ¹	River Mile	Document Title	Document type	Date Document Creation	Project Location	Sample Types/Report Info	Author
RM 3.7_Boeing S Park Facility_west bank	17	3.7	Report of Foundation Investigation	figures/logs	06.17.1980	1420 S. Trenton Street	7 boring logs and figures	Dames & Moore
Boeing Plant 2 CPT Locations	18	3.7	CPT Locations	figure	02.09.2015	POS Parcel Boeing Isaacson	CPTs (up to 60 feet bgs)	Kennedy/Jenks
RM 3.8_1600 S Henderson St_west bank	19	3.8	Supplemental Laboratory Testing	figures/logs	09.20.1984	South Park Site: 1600 S. Henderson St.	7 boring logs	Dames & Moore
RM 4.25_Delta Boat Lift Pier_west bank	20	4.25	Limited Geotechnical Engineering Report	report	5.8.2002	Boat Lift Pier 1608 S 96th Street	1 bore hole, two grain size, 200-wash analysis, Atterberg limits	AMEC
RM_4.4_Duwamish Substation_west bank	21	4.4	Geotechnical Report Duwamish Substation Bank 79 Foundation Retrofit	report	2.28.2003	Bank 79 Transformer: (near west marginal way)	1 PCPT, 2 geophysical surveys, 3 soil borings and analysis, borings completed for MWs	Earth Technology Corporation
RM_4.4_Duwamish Substation_west bank2	22	4.4	n/a	figures/logs	10.07.1969	Duwamish Substation	47 borings (logs with coordinates)	Seattle Engineering Department
Draft Duwamish Substation Geotech Rpt	23	4.45	Draft Geotechnical Report Seattle Substation Evaluation	draft report	11.2012	Duwamish Substation	Surface/subsurface conditions, environmentally critical areas, seismic considerations, foundations, earthwork	Seattle Public Utilities Geotechnical Engineering
RM 4.4-4.6_Boeing_east bank	24	4.4-4.6	Boeing Developmental Center Logs	figures/logs	2.1.2001	East Marginal Way South (Boeing Developmental Center)	MW well as-builts, site map, lithology logs (about 30 wells)	Landau Associates
USACE Dredging 2018	25	4.0-4.7	Memorandum For Record: DMMP Suitability Determination	report	05.24.2018	Duwamish River: Stations 242+00 and 275+56 (turning basin and navigation channel)	Vibracore samples (grain size/conventional) page 18	USACE
RM 4.6-7.7_Hwy 99_west bank	26	4.6-7.7	Report on Geotechnical Exploration	report	05.30.1985	Renton Effluent Transfer System. West Marginal Way Southwest, extending from about 1,500 south of South 102nd Street to 800 feet north of Des Moines Way South	Plan and profile maps, 21 exploration borings, trench excavation, chemical testing, GW conditions, geotechnical impacts	Converse Consultants
RM 5_Oxbow bridge	27	5.0	Geotechnical Design Report	report	4.1988	North Oxbow Bridge, Boeing Developmental Center	Surface/subsurface conditions, SPTs, GW, seismic considerations, vertical/lateral pile capacity, liquefaction potential, excavation	Rittenhouse-Zeman & Associates
RM +5_Boeing Oxbow Parking Lot_west bank	South of study area	5.1	Report of Geotechnical Investigation	report	7.23.1985	Boeing Developmental Center Oxbow Parking lot (west side Duwamish)	2 CPT, 5 borings, deepest boring 54.0 ft	Converse Consultants
LDW-Final-FS-Sections-8-13_october-31-2012_ADA	n/a	n/a	Lower Duwamish Waterway Final Feasibility Study (sections 8-13)	report	10.2012	Duwamish River	Table 8-6: prior geotechnical analyses from projects in the LDW, around Harbor Island, and adjacent Elliott Bay	LDWG
LDW-Final-FS-Sections-1-7_october-31-2012_ADA	n/a	n/a	Lower Duwamish Waterway Final Feasibility Study (sections 1-7)	report	10.2012.	Duwamish River	Section 2.6: additional considerations, sediment physical properties: grain size, Atterberg limits, TOC, porosity, bulk density, etc.	LDWG

File Title	Identification No. ¹	River Mile	Document Title	Document type	Date Document Creation	Project Location	Sample Types/Report Info	Author
Final_LDW-RI	n/a	n/a	Lower Duwamish Waterway Remedial Investigation Report	report	7.9.2010	Duwamish River	Section 2.5.4: sediment lithology: geotechnical parameter tests and results (moisture, specific gravity, Atterberg limits, bulk density, porosity). Also physical properties. Section 9.1.6: bank erosion	LDWG
2015_11_POS_Silver_DSR_Ecology	28	3.8	Boeing Isaacson-Thompson Site, Port of Seattle Sliver Data Summary Report	report	11.12.2015	Port of Seattle Sliver Property located west of the Boeing Isaacson Property	10 soil borings (direct push) to 25 ft bgs. 41 soil samples collected. No geotechnical analysis. Includes section on lithologic conditions of site and borings logs, page 5.	Kennedy/Jenks Consultants
Boeing_I-T_Landau_042114_Final_RI	29	3.8	Final Remedial Investigation Report Boeing Isaacson-Thompson Site	report	4.21.2014	Boeing Isaacson-Thompson Site	No geotechnical analysis. Descriptions of Geologic Conditions on page 107. Discuss soil conditions at 50 exploratory locations. Summary of depth to alluvium documented in Table 9 page 290	Landau Associates, AMEC
AppJ_Basin of Design Report_08162012	30	3.5 - 3.7	Appendix J Geotechnical Basis of Design Report (Terminal 117 Cleanup Design Sediment and Upland Areas)	report	8.1.2012	Port of Seattle, Terminal 117	Six borings and 8 CPTs. 3 completed on barge, 3 completed upland. 5 SPTs completed on barge, 3 completed in upland (locations figure 1 page 23). Geologic soil units described page 10. Engineering soil properties section 3 page 14. Subsurface profile figures begin page 25.	Crete Consulting, Jacobs Associates
2012_12-19_Final Shoreline Investigation	31	4.1-4.2	Shoreline Soil and Groundwater Characterization Report	report	3.12.2012	Former Rhone-Poulenc Site, Tukwila Washington: 9229 East Marginal Way	15 direct push upland borings for soil/GW from shoreline areas. 5 areas collected geotechnical samples between 11 and 15 feet. Section 3.1 soil lithology (page 14). Section 3.5 geotechnical analysis (moisture, density, grain size, atterberg). Results table 8 page 43. Geotech locations figure 3 page 47.	AMEC
Final Interm Measures Construction Work Plan V1/V2	32	4.1-4.2	Final Interm Measures Construction Work Plan V1/V2	report	10.25.2002	Former Rhone-Poulenc Site, Tukwila Washington: 9229 East Marginal Way	Samples to confirm depth and characteristics of uppermost aquitard. CPTs for soil strength at 3 locations alongside borings GT-5, B-1-02, B-7-02 (Section 2.4 Geotech Characterization page 15). Figures page 21. Table 2-1 summarizes analytical. V2: Appendix B: Geotechnical Data	URS
2021.03.05 Figures AppA-1_B-Boeing DC Thompson Geotech Report-01052021_Final_reduced	33	3.7; 4.6; 4.9	Boeing DC Thompson Geotech Report	figures/logs	1.5.2021	Boeing Thompson Site	3 CPTs at Thompson site; 3 CPTs at Boeing Development Center; 3 CPTs near Norfolk outfall	Golder
8801 Final FS July 27, 2020	34	3.9-4.0	Final Feasibility Study 8801 East Marginal Way S., Tukwila, Washington	report	7.27.2020	Centerpoint Properties	Geologic cross sections perpendicular and parallel to the river bank through Centerpoint Properties	Shannon & Wilson

Notes:

1. The study identification number is shown on Maps 5-2a and 5-2b. Studies with "n/a" in this field are site-wide studies.

CPT: cone penetration testing

DMMP: Dredged Material Management Program

GW: groundwater

HSA: hollow stem auger

LDW: Lower Duwamish Waterway

MW: monitoring well

n/a: not applicable
RFI: request for information
RI: remedial investigation
RM: river mile
SPT: standard penetration test
USACE: US Army Corps of Engineers
